# INTERVAL EXCHANGE TRANSFORMATIONS AND LINEAR INVOLUTIONS

# 1.1 Class factories for Interval exchange transformations.

This library is designed for the usage and manipulation of interval exchange transformations and linear involutions. It defines specialized types of permutation (constructed using iet.Permutation()) some associated graph (constructed using iet.RauzyGraph()) and some maps of intervals (constructed using iet.IntervalExchangeTransformation()).

# **EXAMPLES:**

Creation of an interval exchange transformation:

```
sage: T = iet.IntervalExchangeTransformation(('a b','b a'),(sqrt(2),1))
sage: print T
Interval exchange transformation of [0, sqrt(2) + 1[ with permutation
a b
b a
```

It can also be initialized using permutation (group theoretic ones):

```
sage: p = Permutation([3,2,1])
sage: T = iet.IntervalExchangeTransformation(p, [1/3,2/3,1])
sage: print T
Interval exchange transformation of [0, 2[ with permutation
1 2 3
3 2 1
```

For the manipulation of permutations of iet, there are special types provided by this module. All of them can be constructed using the constructor iet.Permutation. For the creation of labelled permutations of interval exchange transformation:

```
sage: p1 = iet.Permutation('a b c', 'c b a')
sage: print p1
a b c
c b a
```

They can be used for initialization of an iet:

```
sage: p = iet.Permutation('a b','b a')
sage: T = iet.IntervalExchangeTransformation(p, [1,sqrt(2)])
sage: print T
Interval exchange transformation of [0, sqrt(2) + 1[ with permutation
```

```
a b
b a
```

You can also, create labelled permutations of linear involutions:

```
sage: p = iet.GeneralizedPermutation('a a b', 'b c c')
sage: print p
a a b
b c c
```

Sometimes it's more easy to deal with reduced permutations:

```
sage: p = iet.Permutation('a b c', 'c b a', reduced = True)
sage: print p
a b c
c b a
```

Permutations with flips:

```
sage: p1 = iet.Permutation('a b c', 'c b a', flips = ['a','c'])
sage: print p1
-a b -c
-c b -a
```

Creation of Rauzy diagrams:

```
sage: r = iet.RauzyDiagram('a b c', 'c b a')
```

Reduced Rauzy diagrams are constructed using the same arguments than for permutations:

```
sage: r = iet.RauzyDiagram('a b b','c c a')
sage: r_red = iet.RauzyDiagram('a b b','c c a',reduced=True)
sage: r.cardinality()
12
sage: r_red.cardinality()
4
```

By defaut, Rauzy diagram are generated by induction on the right. You can use several options to enlarge (or restrict) the diagram (try help(iet.RauzyDiagram) for more precisions):

```
sage: r1 = iet.RauzyDiagram('a b c','c b a',right_induction=True)
sage: r2 = iet.RauzyDiagram('a b c','c b a',left_right_inversion=True)
```

You can consider self similar iet using path in Rauzy diagrams and eigenvectors of the corresponding matrix:

```
sage: p = iet.Permutation("a b c d", "d c b a")
sage: d = p.rauzy_diagram()
sage: g = d.path(p, 't', 't', 'b', 't', 'b', 't', 'b')
sage: g
Path of length 8 in a Rauzy diagram
sage: g.is_loop()
True
sage: g.is_full()
True
sage: m = g.matrix()
sage: v = m.eigenvectors_right()[-1][1][0]
sage: T1 = iet.IntervalExchangeTransformation(p, v)
sage: T2 = T1.rauzy_move(iterations=8)
```

```
sage: T1.normalize(1) == T2.normalize(1)
True
```

# **REFERENCES:**

#### **AUTHORS:**

• Vincent Delecroix (2009-09-29): initial version

Returns a permutation of an interval exchange transformation.

Those permutations are the combinatoric part of linear involutions and were introduced by Danthony-Nogueira [DN90]. The full combinatoric study and precise links with strata of quadratic differentials was achieved few years later by Boissy-Lanneau [BL08].

# INPUT:

- •intervals strings, list, tuples
- •reduced boolean (defaut: False) specifies reduction. False means labelled permutation and True means reduced permutation.
- •flips iterable (default: None) the letters which correspond to flipped intervals.

# **OUTPUT:**

generalized permutation – the output type depends on the data.

# **EXAMPLES:**

Creation of labelled generalized permutations:

```
sage: iet.GeneralizedPermutation('a b b','c c a')
a b b
c c a
sage: iet.GeneralizedPermutation('a a','b b c c')
a a
b b c c
sage: iet.GeneralizedPermutation([[0,1,2,3,1],[4,2,5,3,5,4,0]])
0 1 2 3 1
4 2 5 3 5 4 0
```

# Creation of reduced generalized permutations:

```
sage: iet.GeneralizedPermutation('a b b', 'c c a', reduced = True)
a b b
c c a
sage: iet.GeneralizedPermutation('a a b b', 'c c d d', reduced = True)
a a b b
c c d d
```

# Creation of flipped generalized permutations:

Traceback (most recent call last):

```
sage: iet.GeneralizedPermutation('a b c a', 'd c d b', flips = ['a','b'])
-a -b c -a
d c d -b

TESTS:
sage: iet.GeneralizedPermutation('a a b b', 'c c d d', reduced = 'may')
```

```
1.1. Class factories for Interval exchange transformations.
```

```
TypeError: reduced must be of type boolean
sage: iet.GeneralizedPermutation('a b c a', 'd c d b', flips = ['e','b'])
Traceback (most recent call last):
...
TypeError: The flip list is not valid
sage: iet.GeneralizedPermutation('a b c a', 'd c c b', flips = ['a','b'])
Traceback (most recent call last):
...
ValueError: Letters must reappear twice
```

sage.dynamics.interval\_exchanges.constructors.IET (permutation=None, lengths=None)
Constructs an Interval exchange transformation.

An interval exchange transformation (or iet) is a map from an interval to itself. It is defined on the interval except at a finite number of points (the singularities) and is a translation on each connected component of the complement of the singularities. Moreover it is a bijection on its image (or it is injective).

An interval exchange transformation is encoded by two datas. A permutation (that corresponds to the way we echange the intervals) and a vector of positive reals (that corresponds to the lengths of the complement of the singularities).

# INPUT:

```
•permutation - a permutation
```

•lengths - a list or a dictionary of lengths

# **OUTPUT:**

interval exchange transformation – an map of an interval

# **EXAMPLES:**

Two initialization methods, the first using a iet.Permutation:

```
sage: p = iet.Permutation('a b c','c b a')
sage: t = iet.IntervalExchangeTransformation(p, {'a':1,'b':0.4523,'c':2.8})
```

The second is more direct:

```
sage: t = iet.IntervalExchangeTransformation(('a b','b a'), {'a':1,'b':4})
```

It's also possible to initialize the lengths only with a list:

```
sage: t = iet.IntervalExchangeTransformation(('a b c','c b a'),[0.123,0.4,2])
```

The two fundamental operations are Rauzy move and normalization:

```
sage: t = iet.IntervalExchangeTransformation(('a b c','c b a'),[0.123,0.4,2])
sage: s = t.rauzy_move()
sage: s_n = s.normalize(t.length())
sage: s_n.length() == t.length()
True
```

A not too simple example of a self similar interval exchange transformation:

```
sage: p = iet.Permutation('a b c d','d c b a')
sage: d = p.rauzy_diagram()
sage: g = d.path(p, 't', 't', 'b', 't', 'b', 't', 'b')
sage: m = g.matrix()
sage: v = m.eigenvectors_right()[-1][1][0]
sage: t = iet.IntervalExchangeTransformation(p,v)
sage: s = t.rauzy_move(iterations=8)
```

```
sage: s.normalize() == t.normalize()
True

TESTS:
sage: iet.IntervalExchangeTransformation(('a b c','c b a'),[0.123,2])
Traceback (most recent call last):
...
ValueError: bad number of lengths
sage: iet.IntervalExchangeTransformation(('a b c','c b a'),[0.1,'rho',2])
Traceback (most recent call last):
...
TypeError: unable to convert x (='rho') into a real number
sage: iet.IntervalExchangeTransformation(('a b c','c b a'),[0.1,-2,2])
Traceback (most recent call last):
...
ValueError: lengths must be positive
```

Constructs an Interval exchange transformation.

An interval exchange transformation (or iet) is a map from an interval to itself. It is defined on the interval except at a finite number of points (the singularities) and is a translation on each connected component of the complement of the singularities. Moreover it is a bijection on its image (or it is injective).

An interval exchange transformation is encoded by two datas. A permutation (that corresponds to the way we echange the intervals) and a vector of positive reals (that corresponds to the lengths of the complement of the singularities).

# INPUT:

- •permutation a permutation
- •lengths a list or a dictionary of lengths

### **OUTPUT:**

interval exchange transformation - an map of an interval

# **EXAMPLES:**

Two initialization methods, the first using a iet.Permutation:

```
sage: p = iet.Permutation('a b c','c b a')
sage: t = iet.IntervalExchangeTransformation(p, {'a':1,'b':0.4523,'c':2.8})
```

The second is more direct:

```
sage: t = iet.IntervalExchangeTransformation(('a b','b a'),{'a':1,'b':4})
```

It's also possible to initialize the lengths only with a list:

```
sage: t = iet.IntervalExchangeTransformation(('a b c','c b a'),[0.123,0.4,2])
```

The two fundamental operations are Rauzy move and normalization:

```
sage: t = iet.IntervalExchangeTransformation(('a b c','c b a'),[0.123,0.4,2])
sage: s = t.rauzy_move()
sage: s_n = s.normalize(t.length())
sage: s_n.length() == t.length()
True
```

A not too simple example of a self similar interval exchange transformation:

```
sage: p = iet.Permutation('a b c d','d c b a')
sage: d = p.rauzy_diagram()
sage: g = d.path(p, 't', 't', 'b', 't', 'b', 't', 'b')
sage: m = g.matrix()
sage: v = m.eigenvectors_right()[-1][1][0]
sage: t = iet.IntervalExchangeTransformation(p, v)
sage: s = t.rauzy_move(iterations=8)
sage: s.normalize() == t.normalize()
True
TESTS:
sage: iet.IntervalExchangeTransformation(('a b c','c b a'),[0.123,2])
Traceback (most recent call last):
ValueError: bad number of lengths
sage: iet.IntervalExchangeTransformation(('a b c','c b a'),[0.1,'rho',2])
Traceback (most recent call last):
TypeError: unable to convert x (='rho') into a real number
sage: iet.IntervalExchangeTransformation(('a b c','c b a'),[0.1,-2,2])
Traceback (most recent call last):
ValueError: lengths must be positive
```

sage.dynamics.interval\_exchanges.constructors.**Permutation** (\*args, \*\*kargs)
Returns a permutation of an interval exchange transformation.

Those permutations are the combinatoric part of an interval exchange transformation (IET). The combinatorial study of those objects starts with Gerard Rauzy [R79] and William Veech [V78].

The combinatoric part of interval exchange transformation can be taken independently from its dynamical origin. It has an important link with strata of Abelian differential (see strata)

# INPUT:

- •intervals string, two strings, list, tuples that can be converted to two lists
- •reduced boolean (default: False) specifies reduction. False means labelled permutation and True means reduced permutation.
- •flips iterable (default: None) the letters which correspond to flipped intervals.

# **OUTPUT**:

permutation – the output type depends of the data.

# **EXAMPLES:**

# Creation of labelled permutations

```
sage: iet.Permutation('a b c d','d c b a')
a b c d
d c b a
sage: iet.Permutation([[0,1,2,3],[2,1,3,0]])
0 1 2 3
2 1 3 0
sage: iet.Permutation([[0, 'A', 'B', 1], ['B', 0, 1, 'A']))
0 A B 1
B 0 1 A
```

```
Creation of reduced permutations:
    sage: iet.Permutation('a b c', 'c b a', reduced = True)
    a b c
    c b a
    sage: iet.Permutation([0, 1, 2, 3], [1, 3, 0, 2])
    0 1 2 3
    1 3 0 2
    Creation of flipped permutations:
    sage: iet.Permutation('a b c', 'c b a', flips=['a','b'])
    -а -b с
     c -b -a
    sage: iet.Permutation('a b c', 'c b a', flips=['a'], reduced=True)
    -a b c
     c b -a
    TESTS:
    sage: p = iet.Permutation('a b c','c b a')
    sage: iet.Permutation(p) == p
    True
    sage: iet.Permutation(p, reduced=True) == p.reduced()
    True
    sage: p = iet.Permutation('a','a',flips='a',reduced=True)
    sage: iet.Permutation(p) == p
    True
    sage: p = iet.Permutation('a b c','c b a',flips='a')
    sage: iet.Permutation(p) == p
    True
    sage: iet.Permutation(p, reduced=True) == p.reduced()
    sage: p = iet.Permutation('a b c','c b a',reduced=True)
    sage: iet.Permutation(p) == p
    sage: iet.Permutation('a b c','c b a',reduced='badly')
    Traceback (most recent call last):
    TypeError: reduced must be of type boolean
    sage: iet.Permutation('a','a',flips='b',reduced=True)
    Traceback (most recent call last):
    ValueError: flips contains not valid letters
    sage: iet.Permutation('a b c','c a a',reduced=True)
    Traceback (most recent call last):
    ValueError: letters must appear once in each interval
sage.dynamics.interval_exchanges.constructors.Permutations_iterator(nintervals=None,
                                                                             irre-
                                                                             ducible=True.
                                                                             re-
                                                                             duced=False,
                                                                             alpha-
```

bet=None)

Returns an iterator over permutations.

This iterator allows you to iterate over permutations with given constraints. If you want to iterate over permutations coming from a given stratum you have to use the module strata and generate Rauzy diagrams from connected components.

# INPUT:

```
    nintervals - non negative integer
    irreducible - boolean (default: True)
    reduced - boolean (default: False)
    alphabet - alphabet (default: None)
```

### **OUTPUT:**

iterator - an iterator over permutations

# **EXAMPLES:**

Generates all reduced permutations with given number of intervals:

```
sage: P = iet.Permutations_iterator(nintervals=2,alphabet="ab",reduced=True)
sage: for p in P: print p, "\n* *"
a b
b a
sage: P = iet.Permutations_iterator(nintervals=3,alphabet="abc",reduced=True)
sage: for p in P: print p, "\n* * *"
a b c
b c a
a b c
c a b
* * *
a b c
c b a
sage: P = iet.Permutations_iterator(nintervals=None, alphabet=None)
Traceback (most recent call last):
ValueError: You must specify an alphabet or a length
sage: P = iet.Permutations_iterator(nintervals=None, alphabet=ZZ)
Traceback (most recent call last):
ValueError: You must specify a length with infinite alphabet
```

sage.dynamics.interval\_exchanges.constructors.RauzyDiagram(\*args, \*\*kargs)
Return an object coding a Rauzy diagram.

The Rauzy diagram is an oriented graph with labelled edges. The set of vertices corresponds to the permutations obtained by different operations (mainly the .rauzy\_move() operations that corresponds to an induction of interval exchange transformation). The edges correspond to the action of the different operations considered.

It first appeard in the original article of Rauzy [R79].

# INPUT:

•intervals - lists, or strings, or tuples

- •reduced boolean (default: False) to precise reduction
- •flips list (default: []) for flipped permutations
- $\verb| right_induction boolean (default: True) consideration of left induction in the diagram \\$
- •left\_induction boolean (default: False) consideration of right induction in the diagram
- •left\_right\_inversion boolean (default: False) consideration of inversion
- •top\_bottom\_inversion boolean (default: False) consideration of reversion
- •symmetric boolean (default: False) consideration of the symmetric operation

# **OUTPUT:**

Rauzy diagram - the Rauzy diagram that corresponds to your request

# **EXAMPLES:**

# Standard Rauzy diagrams:

```
sage: iet.RauzyDiagram('a b c d', 'd b c a')
Rauzy diagram with 12 permutations
sage: iet.RauzyDiagram('a b c d', 'd b c a', reduced = True)
Rauzy diagram with 6 permutations
```

# Extended Rauzy diagrams:

```
sage: iet.RauzyDiagram('a b c d', 'd b c a', symmetric=True)
Rauzy diagram with 144 permutations
```

# Using Rauzy diagrams and path in Rauzy diagrams:

```
sage: r = iet.RauzyDiagram('a b c', 'c b a')
sage: print r
Rauzy diagram with 3 permutations
sage: p = iet.Permutation('a b c','c b a')
sage: p in r
True
sage: g0 = r.path(p, 'top', 'bottom','top')
sage: g1 = r.path(p, 'bottom', 'top', 'bottom')
sage: print g0.is_loop(), g1.is_loop()
True True
sage: print g0.is_full(), g1.is_full()
False False
sage: g = g0 + g1
sage: q
Path of length 6 in a Rauzy diagram
sage: print g.is_loop(), g.is_full()
True True
sage: m = g.matrix()
sage: print m
[1 1 1]
[2 4 1]
[2 3 2]
sage: s = g.orbit_substitution()
WordMorphism: a->acbbc, b->acbbcbbc, c->acbc
sage: s.incidence_matrix() == m
True
```

We can then create the corresponding interval exchange transformation and comparing the orbit of 0 to the fixed point of the orbit substitution:

```
sage: v = m.eigenvectors_right()[-1][1][0]
sage: T = iet.IntervalExchangeTransformation(p, v).normalize()
sage: print T
Interval exchange transformation of [0, 1[ with permutation
c b a
sage: w1 = []
sage: x = 0
sage: for i in range(20):
....: w1.append(T.in_which_interval(x))
\dots : x = T(x)
sage: w1 = Word(w1)
sage: w1
word: acbbcacbcacbbcbbcacb
sage: w2 = s.fixed_point('a')
sage: w2[:20]
word: acbbcacbcacbbcbbcacb
sage: w2[:20] == w1
True
```

# 1.2 Labelled permutations

A labelled (generalized) permutation is better suited to study the dynamic of a translation surface than a reduced one (see the module sage.dynamics.interval\_exchanges.reduced). The latter is more adapted to the study of strata. This kind of permutation was introduced by Yoccoz [Yoc05] (see also [MMY03]).

In fact, there is a geometric counterpart of labelled permutations. They correspond to translation surfaces with marked outgoing separatrices (i.e. we fix a label for each of them).

Remarks that Rauzy diagram of reduced objects are significantly smaller than the one for labelled object (for the permutation a b d b e / e d c a c the labelled Rauzy diagram contains 8760 permutations, and the reduced only 73). But, as it is in geometrical way, the labelled Rauzy diagram is a covering of the reduced Rauzy diagram.

class sage.dynamics.interval_exchanges.labelled.FlippedLabelledPermutationIET (intervals=None,
                                                                                       al-
                                                                                       pha-
                                                                                       bet=None,
                                                                                       flips=None)
    Bases: sage.dynamics.interval_exchanges.labelled.FlippedLabelledPermutation,
    sage.dynamics.interval_exchanges.template.FlippedPermutationIET,
    sage.dynamics.interval_exchanges.labelled.LabelledPermutationIET
    Flipped labelled permutation from iet.
    EXAMPLES:
    Reducibility testing (does not depends of flips):
    sage: p = iet.Permutation('a b c', 'c b a',flips='a')
    sage: p.is_irreducible()
    sage: q = iet.Permutation('a b c d', 'b a d c', flips='bc')
    sage: q.is_irreducible()
    False
    Rauzy movability and Rauzy move:
    sage: p = iet.Permutation('a b c', 'c b a',flips='a')
    sage: print p
    -a b c
     c b -a
    sage: print p.rauzy_move(1)
    -c -a b
    -c b -a
    sage: print p.rauzy_move(0)
    -a b c
     c -a b
```

Rauzy diagrams:

```
sage: d = iet.RauzyDiagram('a b c d','d a b c',flips='a')
AUTHORS:
   •Vincent Delecroix (2009-09-29): initial version
rauzy_diagram(**kargs)
    Returns the Rauzy diagram associated to this permutation.
    For more information, try help(iet.RauzyDiagram)
    OUTPUT:
    RauzyDiagram - the Rauzy diagram of self
    EXAMPLES:
    sage: p = iet.Permutation('a b c', 'c b a',flips='a')
    sage: p.rauzy_diagram()
    Rauzy diagram with 3 permutations
rauzy_move (winner=None, side=None)
    Returns the Rauzy move.
    INPUT:
       •winner - 'top' (or 't' or 0) or 'bottom' (or 'b' or 1)
       •side - (default: 'right') 'right' (or 'r') or 'left' (or 'l')
    OUTPUT:
    permutation - the Rauzy move of self
    EXAMPLES:
    sage: p = iet.Permutation('a b','b a',flips='a')
    sage: p.rauzy_move('top')
    -a b
    b -a
    sage: p.rauzy_move('bottom')
    -b -a
    -b -a
    sage: p = iet.Permutation('a b c','c b a',flips='b')
    sage: p.rauzy_move('top')
     a -b c
     c a -b
    sage: p.rauzy_move('bottom')
     a c -b
     c -b a
reduced()
    The associated reduced permutation.
    OUTPUT:
    permutation – the associated reduced permutation
    EXAMPLES:
    sage: p = iet.Permutation('a b c','c b a',flips='a')
    sage: q = iet.Permutation('a b c','c b a',flips='a',reduced=True)
    sage: p.reduced() == q
    True
```

```
class sage.dynamics.interval_exchanges.labelled.FlippedLabelledPermutationLI (intervals=None,
                                                                                       al-
                                                                                       pha-
                                                                                       bet=None,
                                                                                       flips=None)
    Bases: sage.dynamics.interval_exchanges.labelled.FlippedLabelledPermutation,
    sage.dynamics.interval exchanges.template.FlippedPermutationLI,
    sage.dynamics.interval_exchanges.labelled.LabelledPermutationLI
    Flipped labelled quadratic (or generalized) permutation.
    EXAMPLES:
    Reducibility testing:
    sage: p = iet.GeneralizedPermutation('a b b', 'c c a', flips='a')
    sage: p.is_irreducible()
    Reducibility testing with associated decomposition:
    sage: p = iet.GeneralizedPermutation('a b c a', 'b d d c', flips='ab')
    sage: p.is_irreducible()
    False
    sage: test, decomp = p.is_irreducible(return_decomposition = True)
    sage: print test
    False
    sage: print decomp
     (['a'], ['c', 'a'], [], ['c'])
    Rauzy movability and Rauzy move:

    ссаа
rauzy_diagram(**kargs)
    Returns the associated Rauzy diagram.
    For more information, try help(RauzyDiagram)
    OUTPUT:
    - a RauzyDiagram
    EXAMPLES:
    sage: p = iet.GeneralizedPermutation('a b b a', 'c d c d')
    sage: d = p.rauzy_diagram()
reduced()
    The associated reduced permutation.
    OUTPUT:
    permutation – the associated reduced permutation
    EXAMPLE:
    sage: p = iet.GeneralizedPermutation('a a','b b c c',flips='a')
    sage: q = iet.GeneralizedPermutation('a a','b b c c',flips='a',reduced=True)
    sage: p.reduced() == q
    True
right_rauzy_move (winner)
    Perform a Rauzy move on the right (the standard one).
    INPUT:
       •winner - either 'top' or 'bottom' ('t' or 'b' for short)
    OUTPUT:
    permutation - the Rauzy move of self
    EXAMPLES:
    sage: p = iet.GeneralizedPermutation('a a b','b c c',flips='c')
    sage: p.right_rauzy_move(0)
     a a b
    -c b -c
    sage: p.right_rauzy_move(1)
     a a
    -b -c -b -c
    sage: p = iet.GeneralizedPermutation('a b b','c c a',flips='ab')
    sage: p.right_rauzy_move(0)
     a -b a -b
```

                                                                                          met-
                                                                                          ric = False)
                    sage.dynamics.interval_exchanges.template.FlippedRauzyDiagram,
     sage.dynamics.interval_exchanges.labelled.LabelledRauzyDiagram
     Rauzy diagram of flipped labelled permutations
class sage.dynamics.interval_exchanges.labelled.LabelledPermutation(intervals=None,
                                                                                alpha-
                                                                                bet=None)
     Bases: sage.structure.sage_object.SageObject
     General template for labelled objects.
      Warning: Internal class! Do not use directly!
     erase_letter(letter)
         Return the permutation with the specified letter removed.
         OUTPUT:
         permutation – the resulting permutation
         EXAMPLES:
         sage: p = iet.Permutation('a b c d','c d b a')
         sage: p.erase_letter('a')
         bcd
         c d b
         sage: p.erase_letter('b')
         sage: p.erase_letter('c')
         a b d
         d b a
         sage: p.erase_letter('d')
         a b c
         c b a
         sage: p = iet.GeneralizedPermutation('a b b','c c a')
         sage: p.erase_letter('a')
         b b
         CC
         Beware, there is no validity check for permutation from linear involutions:
         sage: p = iet.GeneralizedPermutation('a b b','c c a')
```

sage: p.erase\_letter('b')

```
а
    сса
length (interval=None)
    Returns a 2-uple of lengths.
    p.length() is identical to (p.length_top(), p.length_bottom()) If an interval is specified, it returns the length
    of the specified interval.
    INPUT:
       •interval - None, 'top' or 'bottom'
    OUTPUT:
    tuple – a 2-uple of integers
    EXAMPLES:
    sage: iet.Permutation('a b c','c b a').length()
    sage: iet.GeneralizedPermutation('a a','b b c c').length()
    sage: iet.GeneralizedPermutation('a a b b','c c').length()
     (4, 2)
length_bottom()
    Returns the number of intervals in the bottom segment.
    OUTPUT:
    integer – number of intervals
    EXAMPLES:
    sage: iet.Permutation('a b','b a').length_bottom()
    sage: iet.GeneralizedPermutation('a a','b b c c').length_bottom()
    sage: iet.GeneralizedPermutation('a a b b','c c').length_bottom()
length_top()
    Returns the number of intervals in the top segment.
    OUTPUT:
    integer – number of intervals
    EXAMPLES:
    sage: iet.Permutation('a b c','c b a').length_top()
    sage: iet.GeneralizedPermutation('a a','b b c c').length_top()
    sage: iet.GeneralizedPermutation('a a b b','c c').length_top()
list()
    Returns a list of two lists corresponding to the intervals.
    OUTPUT:
```

list - two lists of labels

# **EXAMPLES:**

```
The list of an permutation from iet:
    sage: p1 = iet.Permutation('1 2 3', '3 1 2')
    sage: p1.list()
    [['1', '2', '3'], ['3', '1', '2']]
    sage: p1.alphabet("abc")
    sage: p1.list()
    [['a', 'b', 'c'], ['c', 'a', 'b']]
    Recovering the permutation from this list (and the alphabet):
    sage: q1 = iet.Permutation(p1.list(),alphabet=p1.alphabet())
    sage: p1 == q1
    True
    The list of a quadratic permutation:
    sage: p2 = iet.GeneralizedPermutation('g o o', 'd d g')
    sage: p2.list()
    [['g', 'o', 'o'], ['d', 'd', 'g']]
    Recovering the permutation:
    sage: q2 = iet.GeneralizedPermutation(p2.list(),alphabet=p2.alphabet())
    sage: p2 == q2
    True
rauzy_move_loser (winner=None, side=None)
    Returns the loser of a Rauzy move
    INPUT:
       •winner - either 'top' or 'bottom' ('t' or 'b' for short)
       •side - either 'left' or 'right' ('l' or 'r' for short)
    OUTPUT:
    – a label
    EXAMPLES:
    sage: p = iet.Permutation('a b c d','b d a c')
    sage: p.rauzy_move_loser('top','right')
    ′ c′
    sage: p.rauzy_move_loser('bottom','right')
    ' d'
    sage: p.rauzy_move_loser('top','left')
    sage: p.rauzy_move_loser('bottom','left')
rauzy_move_matrix (winner=None, side='right')
```

Returns the Rauzy move matrix.

This matrix corresponds to the action of a Rauzy move on the vector of lengths. By convention (to get a positive matrix), the matrix is defined as the inverse transformation on the length vector.

# **OUTPUT:**

matrix – a square matrix of positive integers

```
EXAMPLES:
         sage: p = iet.Permutation('a b','b a')
         sage: p.rauzy_move_matrix('t')
         [1 0]
         [1 1]
         sage: p.rauzy_move_matrix('b')
         [1 1]
         [0 1]
         sage: p = iet.Permutation('a b c d','b d a c')
         sage: q = p.left_right_inverse()
         sage: m0 = p.rauzy_move_matrix(winner='top', side='right')
         sage: n0 = q.rauzy_move_matrix(winner='top', side='left')
         sage: m0 == n0
         sage: m1 = p.rauzy_move_matrix(winner='bottom', side='right')
         sage: n1 = q.rauzy_move_matrix(winner='bottom', side='left')
         sage: m1 == n1
         True
    rauzy move winner (winner=None, side=None)
         Returns the winner of a Rauzy move.
         INPUT:
            •winner - either 'top' or 'bottom' ('t' or 'b' for short)
            •side - either 'left' or 'right' ('l' or 'r' for short)
         OUTPUT:
         - a label
         EXAMPLES:
         sage: p = iet.Permutation('a b c d','b d a c')
         sage: p.rauzy_move_winner('top','right')
         sage: p.rauzy_move_winner('bottom','right')
         sage: p.rauzy_move_winner('top','left')
         'a'
         sage: p.rauzy_move_winner('bottom','left')
         'b'
         sage: p = iet.GeneralizedPermutation('a b b c','d c a e d e')
         sage: p.rauzy_move_winner('top','right')
         sage: p.rauzy_move_winner('bottom','right')
         sage: p.rauzy_move_winner('top','left')
         sage: p.rauzy_move_winner('bottom','left')
         ' d'
class sage.dynamics.interval exchanges.labelled.LabelledPermutationIET (intervals=None,
                                                                                alpha-
                                                                                bet=None)
                   sage.dynamics.interval_exchanges.labelled.LabelledPermutation,

c a b
Rauzy diagram:
sage: p = iet.Permutation('a b c', 'c b a')
sage: d = p.rauzy_diagram()
sage: p in d
True
has_rauzy_move (winner=None, side=None)
    Returns True if you can perform a Rauzy move.
    INPUT:
       •winner - the winner interval ('top' or 'bottom')
       •side - (default: 'right') the side ('left' or 'right')
    OUTPUT:
    bool - True if self has a Rauzy move
    EXAMPLES:
    sage: p = iet.Permutation('a b','b a')
    sage: p.has_rauzy_move()
    True
    sage: p = iet.Permutation('a b c','b a c')
    sage: p.has_rauzy_move()
    False
is_identity()
    Returns True if self is the identity.
    OUTPUT:
```

bool – True if self corresponds to the identity

```
EXAMPLES:
    sage: iet.Permutation("a b", "a b").is_identity()
    sage: iet.Permutation("a b", "b a").is_identity()
    False
rauzy_diagram(**args)
    Returns the associated Rauzy diagram.
    For more information try help(iet.RauzyDiagram).
    OUTPUT:
    Rauzy diagram - the Rauzy diagram of the permutation
    EXAMPLES:
    sage: p = iet.Permutation('a b c', 'c b a')
    sage: d = p.rauzy_diagram()
rauzy_move (winner=None, side=None, iteration=1)
    Returns the Rauzy move.
    INPUT:
       •winner - the winner interval ('top' or 'bottom')
       •side - (default: 'right') the side ('left' or 'right')
    OUTPUT:
    permutation – the Rauzy move of the permutation
    EXAMPLES:
    sage: p = iet.Permutation('a b','b a')
    sage: p.rauzy_move('t','right')
    a b
    b a
    sage: p.rauzy_move('b','right')

    sage: p.rauzy_move('t','left')
    a b
    b a
    sage: p.rauzy_move('b','left')
    a b
    b a
    sage: p = iet.Permutation('a b c','c b a')
    sage: p.rauzy_move('t','left')
    a b c
```

bса

```
sage: p.rauzy_move('b','left')
    bac
    c b a
rauzy_move_interval_substitution (winner=None, side=None)
    Returns the interval substitution associated.
    INPUT:
       •winner - the winner interval ('top' or 'bottom')
       •side - (default: 'right') the side ('left' or 'right')
    OUTPUT:
    WordMorphism – a substitution on the alphabet of the permutation
    EXAMPLES:
    sage: p = iet.Permutation('a b','b a')
    sage: p.rauzy_move_interval_substitution('top','right')
    WordMorphism: a->a, b->ba
    sage: p.rauzy_move_interval_substitution('bottom','right')
    WordMorphism: a->ab, b->b
    sage: p.rauzy_move_interval_substitution('top','left')
    WordMorphism: a->ba, b->b
    sage: p.rauzy_move_interval_substitution('bottom','left')
    WordMorphism: a->a, b->ab
rauzy_move_orbit_substitution(winner=None, side=None)
    Return the action of the rauzy_move on the orbit.
    INPUT:
       •i - integer
       •winner - the winner interval ('top' or 'bottom')
       •side - (default: 'right') the side ('right' or 'left')
    OUTPUT:
    WordMorphism – a substitution on the alphabet of self
    EXAMPLES:
    sage: p = iet.Permutation('a b','b a')
    sage: p.rauzy_move_orbit_substitution('top','right')
    WordMorphism: a->ab, b->b
    sage: p.rauzy_move_orbit_substitution('bottom','right')
    WordMorphism: a->a, b->ab
    sage: p.rauzy_move_orbit_substitution('top','left')
    WordMorphism: a->a, b->ba
    sage: p.rauzy_move_orbit_substitution('bottom','left')
    WordMorphism: a->ba, b->b
reduced()
    Returns the associated reduced abelian permutation.
    OUTPUT:
    a reduced permutation – the underlying reduced permutation
    EXAMPLES:
```

```
sage: p = iet.Permutation("a b c d","d c a b")
sage: q = iet.Permutation("a b c d","d c a b",reduced=True)
sage: p.reduced() == q
True
```

Bases: sage.dynamics.interval\_exchanges.labelled.LabelledPermutation, sage.dynamics.interval\_exchanges.template.PermutationLI

Labelled quadratic (or generalized) permutation

# **EXAMPLES:**

# Reducibility testing:

```
sage: p = iet.GeneralizedPermutation('a b b', 'c c a')
sage: p.is_irreducible()
True
```

# Reducibility testing with associated decomposition:

```
sage: p = iet.GeneralizedPermutation('a b c a', 'b d d c')
sage: p.is_irreducible()
False
sage: test, decomposition = p.is_irreducible(return_decomposition = True)
sage: print test
False
sage: print decomposition
(['a'], ['c', 'a'], [], ['c'])
```

# Rauzy movability and Rauzy move:

```
sage: p = iet.GeneralizedPermutation('a a b b c c', 'd d')
sage: p.has_rauzy_move(0)
False
sage: p.has_rauzy_move(1)
True
sage: q = p.rauzy_move(1)
sage: print q
a a b b c
c d d
sage: q.has_rauzy_move(0)
True
sage: q.has_rauzy_move(1)
True
```

# Rauzy diagrams:

```
sage: p = iet.GeneralizedPermutation('0 0 1 1','2 2')
sage: r = p.rauzy_diagram()
sage: p in r
True
```

# has\_right\_rauzy\_move (winner)

Test of Rauzy movability with a specified winner

A quadratic (or generalized) permutation is rauzy\_movable type depending on the possible length of the last interval. It is dependent of the length equation.

```
INPUT:
       •winner - 'top' (or 't' or 0) or 'bottom' (or 'b' or 1)
    OUTPUT:
    bool - True if self has a Rauzy move
    EXAMPLES:
    sage: p = iet.GeneralizedPermutation('a a','b b')
    sage: p.has_right_rauzy_move('top')
    False
    sage: p.has_right_rauzy_move('bottom')
    False
    sage: p = iet.GeneralizedPermutation('a a b','b c c')
    sage: p.has_right_rauzy_move('top')
    sage: p.has_right_rauzy_move('bottom')
    True
    sage: p = iet.GeneralizedPermutation('a a','b b c c')
    sage: p.has_right_rauzy_move('top')
    sage: p.has_right_rauzy_move('bottom')
    False
    sage: p = iet.GeneralizedPermutation('a a b b','c c')
    sage: p.has_right_rauzy_move('top')
    False
    sage: p.has_right_rauzy_move('bottom')
    True
left rauzy move(winner)
    Perform a Rauzy move on the left.
    INPUT:
       •winner - 'top' or 'bottom'
    OUTPUT:
    permutation - the Rauzy move of self
    EXAMPLES:
    sage: p = iet.GeneralizedPermutation('a a b','b c c')
    sage: p.left_rauzy_move(0)
    aabb
    СС
    sage: p.left_rauzy_move(1)
    a a b
    bсс
    sage: p = iet.GeneralizedPermutation('a b b','c c a')
    sage: p.left_rauzy_move(0)
    a b b
    сса
    sage: p.left_rauzy_move(1)
    ссаа
```

```
TESTS:
    sage: p = iet.GeneralizedPermutation('a a b','b c c')
    sage: q = p.top_bottom_inverse()
    sage: q = q.left_rauzy_move(0)
    sage: q = q.top_bottom_inverse()
    sage: q == p.left_rauzy_move(1)
    sage: q = p.top_bottom_inverse()
    sage: q = q.left_rauzy_move(1)
    sage: q = q.top_bottom_inverse()
    sage: q == p.left_rauzy_move(0)
    sage: q = p.left_right_inverse()
    sage: q = q.right_rauzy_move(0)
    sage: q = q.left_right_inverse()
    sage: q == p.left_rauzy_move(0)
    sage: q = p.left_right_inverse()
    sage: q = q.right_rauzy_move(1)
    sage: q = q.left_right_inverse()
    sage: q == p.left_rauzy_move(1)
    True
rauzy diagram (**kargs)
    Returns the associated RauzyDiagram.
    OUTPUT:
    Rauzy diagram - the Rauzy diagram of the permutation
    EXAMPLES:
    sage: p = iet.GeneralizedPermutation('a b c b', 'c d d a')
    sage: d = p.rauzy_diagram()
    sage: p in d
    True
    For more information, try help(iet.RauzyDiagram)
reduced()
    Returns the associated reduced quadratic permutations.
    OUTPUT:
    permutation – the underlying reduced permutation
    EXAMPLES:
    sage: p = iet.GeneralizedPermutation('a a','b b c c')
    sage: q = p.reduced()
    sage: q
    аа
    bbcc
    sage: p.rauzy_move(0).reduced() == q.rauzy_move(0)
    True
right_rauzy_move (winner)
    Perform a Rauzy move on the right (the standard one).
    INPUT:
       •winner - 'top' (or 't' or 0) or 'bottom' (or 'b' or 1)
```

# **OUTPUT**:

boolean - True if self has a Rauzy move

```
EXAMPLES:
```

```
sage: p = iet.GeneralizedPermutation('a a b','b c c')
sage: p.right_rauzy_move(0)
a a b
b c c
sage: p.right_rauzy_move(1)
bbcc
sage: p = iet.GeneralizedPermutation('a b b','c c a')
sage: p.right_rauzy_move(0)

sage: q = q.top_bottom_inverse()
sage: q == p.right_rauzy_move(0)
True
sage: p = p.left_right_inverse()
sage: q = q.left_rauzy_move(0)
sage: q = q.left_right_inverse()
sage: q == p.right_rauzy_move(0)
sage: q = p.left_right_inverse()
sage: q = q.left_rauzy_move(1)
sage: q = q.left_right_inverse()
sage: q == p.right_rauzy_move(1)
```

sage.dynamics.interval\_exchanges.labelled.LabelledPermutationsIET\_iterator (nintervals=None,

irreducible=True, alphabet=None)

Returns an iterator over labelled permutations.

### INPUT:

- •nintervals integer or None
- •irreducible boolean (default: True)
- •alphabet something that should be converted to an alphabet of at least nintervals letters

# **OUTPUT**:

iterator – an iterator over permutations

```
TESTS:

                                                                                  ric=False)
     Bases: sage.dynamics.interval_exchanges.template.RauzyDiagram
     Template for Rauzy diagrams of labelled permutations.
      Warning: DO NOT USE
     class Path (parent, *data)
         Bases: sage.dynamics.interval_exchanges.template.RauzyDiagram.Path
         Path in Labelled Rauzy diagram.
         dual_substitution()
             Returns the substitution of intervals obtained.
             OUTPUT:
             WordMorphism – the word morphism corresponding to the interval
             EXAMPLES:
             sage: p = iet.Permutation('a b','b a')
             sage: r = p.rauzy_diagram()
             sage: p0 = r.path(p, 0)
             sage: s0 = p0.interval_substitution()
             sage: s0
```

```
sage: p = iet.Permutation('a b','b a')
sage: r = p.rauzy_diagram()
sage: p0 = r.path(p,0)
sage: s0 = p0.interval_substitution()
sage: s0
WordMorphism: a->a, b->ba
sage: p1 = r.path(p,1)
sage: s1 = p1.interval_substitution()
sage: s1
WordMorphism: a->ab, b->b
sage: (p0 + p1).interval_substitution() == s1 * s0
True
sage: (p1 + p0).interval_substitution() == s0 * s1
```

# interval substitution()

Returns the substitution of intervals obtained.

# **OUTPUT**:

WordMorphism – the word morphism corresponding to the interval

**EXAMPLES:** 

```
sage: p = iet.Permutation('a b','b a')
sage: r = p.rauzy_diagram()
sage: p0 = r.path(p,0)
sage: s0 = p0.interval_substitution()
sage: s0
WordMorphism: a->a, b->ba
sage: p1 = r.path(p,1)
sage: s1 = p1.interval_substitution()
sage: s1
WordMorphism: a->ab, b->b
sage: (p0 + p1).interval_substitution() == s1 * s0
True
sage: (p1 + p0).interval_substitution() == s0 * s1
```

# is\_full()

Tests the fullness.

A path is full if all intervals win at least one time.

#### **OUTPUT**:

boolean - True if the path is full and False else

# **EXAMPLE:**

```
sage: p = iet.Permutation('a b c','c b a')
sage: r = p.rauzy_diagram()
sage: g0 = r.path(p,'t','b','t')
sage: g1 = r.path(p,'b','t','b')
sage: g0.is_full()
False
sage: g1.is_full()
False
sage: (g0 + g1).is_full()
True
sage: (g1 + g0).is_full()
```

Returns the matrix associated to a path.

The matrix associated to a Rauzy induction, is the linear application that allows to recover the lengths of self from the lengths of the induced.

# OUTPUT:

matrix()

matrix - a square matrix of integers

# **EXAMPLES:**

```
sage: p = iet.Permutation('a1 a2','a2 a1')
sage: d = p.rauzy_diagram()
sage: g = d.path(p,'top')
sage: g.matrix()
[1 0]
[1 1]
sage: g = d.path(p,'bottom')
sage: g.matrix()
[1 1]
[0 1]
```

```
sage: p = iet.Permutation('a b c','c b a')
sage: d = p.rauzy_diagram()
sage: g = d.path(p)
sage: g.matrix() == identity_matrix(3)
True
sage: g = d.path(p,'top')
sage: g.matrix()
[1 0 0]
[0 1 0]
[1 0 1]
sage: g = d.path(p,'bottom')
sage: g.matrix()
[1 0 1]
[0 1 0]
[0 1 0]
[0 1 0]
```

# orbit\_substitution()

Returns the substitution on the orbit of the left extremity.

# **OUTPUT**:

WordMorhpism – the word morphism corresponding to the orbit

# **EXAMPLES:**

```
sage: p = iet.Permutation('a b','b a')
sage: d = p.rauzy_diagram()
sage: g0 = d.path(p,'top')
sage: s0 = g0.orbit_substitution()
sage: s0
WordMorphism: a->ab, b->b
sage: g1 = d.path(p,'bottom')
sage: s1 = g1.orbit_substitution()
sage: s1
WordMorphism: a->a, b->ab
sage: (g0 + g1).orbit_substitution() == s0 * s1
True
sage: (g1 + g0).orbit_substitution() == s1 * s0
```

# substitution()

Returns the substitution on the orbit of the left extremity.

# **OUTPUT**:

WordMorhpism – the word morphism corresponding to the orbit

# EXAMPLES:

```
sage: p = iet.Permutation('a b','b a')
sage: d = p.rauzy_diagram()
sage: g0 = d.path(p,'top')
sage: s0 = g0.orbit_substitution()
sage: s0
WordMorphism: a->ab, b->b
sage: g1 = d.path(p,'bottom')
sage: s1 = g1.orbit_substitution()
sage: s1
WordMorphism: a->a, b->ab
sage: (g0 + g1).orbit_substitution() == s0 * s1
```

```
sage: (g1 + g0).orbit_substitution() == s1 * s0
        True
LabelledRauzyDiagram.edge_to_interval_substitution(p=None, edge_type=None)
    Returns the interval substitution associated to an edge
    OUTPUT:
    WordMorphism – the WordMorphism corresponding to the edge
    EXAMPLE:
    sage: p = iet.Permutation('a b c','c b a')
    sage: r = p.rauzy_diagram()
    sage: r.edge_to_interval_substitution(None, None)
    WordMorphism: a->a, b->b, c->c
    sage: r.edge_to_interval_substitution(p,0)
    WordMorphism: a->a, b->b, c->ca
    sage: r.edge_to_interval_substitution(p,1)
    WordMorphism: a->ac, b->b, c->c
LabelledRauzyDiagram.edge_to_orbit_substitution(p=None, edge_type=None)
    Returns the interval substitution associated to an edge
    OUTPUT:
    WordMorphism – the word morphism corresponding to the edge
    EXAMPLE:
    sage: p = iet.Permutation('a b c','c b a')
    sage: r = p.rauzy_diagram()
    sage: r.edge_to_orbit_substitution(None, None)
    WordMorphism: a->a, b->b, c->c
    sage: r.edge_to_orbit_substitution(p,0)
    WordMorphism: a->ac, b->b, c->c
    sage: r.edge_to_orbit_substitution(p,1)
    WordMorphism: a->a, b->b, c->ac
LabelledRauzyDiagram.full_loop_iterator(start=None, max_length=1)
    Returns an iterator over all full path starting at start.
    INPUT:
       •start - the start point
       •max length - a limit on the length of the paths
    OUTPUT:
    iterator - iterator over full loops
    EXAMPLE:
    sage: p = iet.Permutation('a b','b a')
    sage: r = p.rauzy_diagram()
    sage: for g in r.full_loop_iterator(p,2):
              print g.matrix(), "\n****"
    [1 1]
    [1 2]
    ****
    [2 1]
    [1 1]
```

```
LabelledRauzyDiagram.full_nloop_iterator(start=None, length=1)
    Returns an iterator over all full loops of given length.
    INPUT:
       •start - the initial permutation
       •length - the length to consider
    OUTPUT:
    iterator – an iterator over the full loops of given length
    EXAMPLE:
    sage: p = iet.Permutation('a b','b a')
    sage: d = p.rauzy_diagram()
    sage: for g in d.full_nloop_iterator(p, 2):
               print g.matrix(), "\n****"
    [1 1]
    [1 2]
    ****
    [2 1]
    [1 1]
```

# 1.3 Reduced permutations

\*\*\*\*

A reduced (generalized) permutation is better suited to study strata of Abelian (or quadratic) holomorphic forms on Riemann surfaces. The Rauzy diagram is an invariant of such a component. Corentin Boissy proved the identification of Rauzy diagrams with connected components of stratas. But the geometry of the diagram and the relation with the strata is not yet totally understood.

# **AUTHORS:**

    sage.dynamics.interval_exchanges.template.FlippedPermutationIET,
    sage.dynamics.interval_exchanges.reduced.ReducedPermutationIET
    Flipped Reduced Permutation from iet
    EXAMPLES
    sage: p = iet.Permutation('a b c', 'c b a', flips=['a'], reduced=True)
    sage: p.rauzy_move(1)
    -а -b с
    -a c -b
```

TESTS:

```
sage: p = iet.Permutation('a b','b a',flips=['a'])
    sage: p == loads(dumps(p))
    True
    list (flips=False)
         Returns a list representation of self.
         INPUT:
            •flips - boolean (default: False) if True the output contains 2-uple of (label, flip)
         EXAMPLES:
         sage: p = iet.Permutation('a b','b a',reduced=True,flips='b')
         sage: p.list(flips=True)
         [[('a', 1), ('b', -1)], [('b', -1), ('a', 1)]]
         sage: p.list(flips=False)
         [['a', 'b'], ['b', 'a']]
         sage: p.alphabet([0,1])
         sage: p.list(flips=True)
         [[(0, 1), (1, -1)], [(1, -1), (0, 1)]]
         sage: p.list(flips=False)
         [[0, 1], [1, 0]]
         One can recover the initial permutation from this list:
         sage: p = iet.Permutation('a b','b a',reduced=True,flips='a')
         sage: iet.Permutation(p.list(), flips=p.flips(), reduced=True) == p
         True
    rauzy_diagram(**kargs)
         Returns the associated Rauzy diagram.
         EXAMPLES:
         sage: p = iet.Permutation('a b','b a',reduced=True,flips='a')
         sage: r = p.rauzy_diagram()
         sage: p in r
         True
class sage.dynamics.interval_exchanges.reduced.FlippedReducedPermutationLI (intervals=None,
                                                                                      flips=None,
                                                                                      al-
                                                                                      pha-
                                                                                      bet=None)
              sage.dynamics.interval_exchanges.reduced.FlippedReducedPermutation,
    sage.dynamics.interval_exchanges.template.FlippedPermutationLI,
    sage.dynamics.interval_exchanges.reduced.ReducedPermutationLI
    Flipped Reduced Permutation from li
    EXAMPLES:
    Creation using the GeneralizedPermutation function:
    sage: p = iet.GeneralizedPermutation('a a b', 'b c c', reduced=True, flips='a')
    list (flips=False)
         Returns a list representation of self.
         INPUT:
```

•flips - boolean (default: False) return the list with flips

```
EXAMPLES:
```

```
sage: p = iet.GeneralizedPermutation('a a','b b',reduced=True,flips='a')
sage: p.list(flips=True)
[[('a', -1), ('a', -1)], [('b', 1), ('b', 1)]]
sage: p.list(flips=False)
[['a', 'a'], ['b', 'b']]

sage: p = iet.GeneralizedPermutation('a a b','b c c',reduced=True,flips='abc')
sage: p.list(flips=True)
[[('a', -1), ('a', -1), ('b', -1)], [('b', -1), ('c', -1), ('c', -1)]]
sage: p.list(flips=False)
[['a', 'a', 'b'], ['b', 'c', 'c']]
```

one can rebuild the permutation from the list:

```
sage: p = iet.GeneralizedPermutation('a a b','b c c',flips='a',reduced=True)
sage: iet.GeneralizedPermutation(p.list(),flips=p.flips(),reduced=True) == p
True
```

## rauzy\_diagram(\*\*kargs)

Returns the associated Rauzy diagram.

For more explanation and a list of arguments try help(iet.RauzyDiagram)

#### **EXAMPLES:**

```
sage: p = iet.GeneralizedPermutation('a a b','c c b',reduced=True)
sage: r = p.rauzy_diagram()
sage: p in r
True
```

class sage.dynamics.interval\_exchanges.reduced.FlippedReducedRauzyDiagram (p,

right\_induction=True, left\_induction=False, left\_right\_inversion=False, top\_bottom\_inversion=Fals symmetric=False)

Bases: sage.dynamics.interval\_exchanges.template.FlippedRauzyDiagram, sage.dynamics.interval\_exchanges.reduced.ReducedRauzyDiagram

Rauzy diagram of flipped reduced permutations.

Bases: sage.structure.sage\_object.SageObject

Template for reduced objects.

```
Warning: Internal class! Do not use directly!
```

# INPUT:

- •intervals a list of two list of labels
- •alphabet (default: None) any object that can be used to initialize an Alphabet or None. In this latter case, the letter of the intervals are used to generate one.

```
erase letter(letter)
    Erases a letter.
    INPUT:
       •letter - a letter which is a label of an interval of self
    EXAMPLES:
    sage: p = iet.Permutation('a b c','c b a')
    sage: p.erase_letter('a')
    c b
    sage: p = iet.GeneralizedPermutation('a b b','c c a')
    sage: p.erase_letter('a')
    b b
    CC
left_rauzy_move(winner)
    Performs a Rauzy move on the left.
    EXAMPLES:
    sage: p = iet.Permutation('a b c','c b a',reduced=True)
    sage: p.left_rauzy_move(0)
    a b c
    bса
    sage: p.right_rauzy_move(1)
    a b c
    bса
    sage: p = iet.GeneralizedPermutation('a a','b b c c',reduced=True)
    sage: p.left_rauzy_move(0)
    a a b
    bcc
length (interval=None)
    Returns the 2-uple of lengths.
    p.length() is identical to (p.length_top(), p.length_bottom()) If an interval is specified, it returns the length
    of the specified interval.
    INPUT:
       •interval - None, 'top' (or 't' or 0) or 'bottom' (or 'b' or 1)
    OUTPUT:
    integer or 2-uple of integers - the corresponding lengths
    EXAMPLES:
    sage: p = iet.Permutation('a b c','c b a')
    sage: p.length()
    (3, 3)
    sage: p = iet.GeneralizedPermutation('a a b','c d c b d')
    sage: p.length()
    (3, 5)
length_bottom()
    Returns the number of intervals in the bottom segment.
```

**OUTPUT**:

integer - the length of the bottom segment

#### **EXAMPLES:**

```
sage: p = iet.Permutation('a b c','c b a')
sage: p.length_bottom()
sage: p = iet.GeneralizedPermutation('a a b','c d c b d')
sage: p.length_bottom()
```

# length\_top()

Returns the number of intervals in the top segment.

#### **OUTPUT:**

integer – the length of the top segment

#### **EXAMPLES:**

```
sage: p = iet.Permutation('a b c','c b a')
sage: p.length_top()
sage: p = iet.GeneralizedPermutation('a a b','c d c b d')
sage: p.length_top()
sage: p = iet.GeneralizedPermutation('a b c b d c d', 'e a e')
sage: p.length_top()
```

# right\_rauzy\_move (winner)

Performs a Rauzy move on the right.

# **EXAMPLES**:

```
sage: p = iet.Permutation('a b c','c b a',reduced=True)
sage: p.right_rauzy_move(0)
a b c
sage: p.right_rauzy_move(1)
a b c
bса
sage: p = iet.GeneralizedPermutation('a a','b b c c',reduced=True)
sage: p.right_rauzy_move(0)
a b b
сса
```

class sage.dynamics.interval\_exchanges.reduced.ReducedPermutationIET (intervals=None, alpha-

sage.dynamics.interval\_exchanges.reduced.ReducedPermutation, sage.dynamics.interval\_exchanges.template.PermutationIET

bet=None)

# Reduced permutation from iet

Permutation from iet without numerotation of intervals. For initialization, you should use GeneralizedPermutation which is the class factory for all permutation types.

### **EXAMPLES:**

Bases:

Equality testing (no equality of letters but just of ordering):

```
sage: p = iet.Permutation('a b c', 'c b a', reduced = True)
sage: q = iet.Permutation('p q r', 'r q p', reduced = True)
sage: p == q
True
Reducibility testing:
sage: p = iet.Permutation('a b c', 'c b a', reduced = True)
sage: p.is_irreducible()
True
sage: q = iet.Permutation('a b c d', 'b a d c', reduced = True)
sage: q.is_irreducible()
False
Rauzy movability and Rauzy move:
sage: p = iet.Permutation('a b c', 'c b a', reduced = True)
sage: p.has_rauzy_move(1)
True
sage: print p.rauzy_move(1)
a b c
bса
Rauzy diagrams:
sage: p = iet.Permutation('a b c d', 'd a b c')
sage: p_red = iet.Permutation('a b c d', 'd a b c', reduced = True)
sage: d = p.rauzy_diagram()
sage: d_red = p_red.rauzy_diagram()
sage: p.rauzy_move(0) in d
sage: print d.cardinality(), d_red.cardinality()
has_rauzy_move (winner, side='right')
    Tests if the permutation is rauzy_movable on the left.
    EXAMPLES:
    sage: p = iet.Permutation('a b c','a c b',reduced=True)
    sage: p.has_rauzy_move(0,'right')
    sage: p.has_rauzy_move(0,'left')
    False
    sage: p.has_rauzy_move(1,'right')
    True
    sage: p.has_rauzy_move(1,'left')
    False
    sage: p = iet.Permutation('a b c d','c a b d',reduced=True)
    sage: p.has_rauzy_move(0,'right')
    False
    sage: p.has_rauzy_move(0,'left')
    True
    sage: p.has_rauzy_move(1,'right')
    sage: p.has_rauzy_move(1,'left')
    True
```

#### is identity()

Returns True if self is the identity.

#### **EXAMPLES:**

```
sage: iet.Permutation("a b","a b",reduced=True).is_identity()
True
sage: iet.Permutation("a b","b a",reduced=True).is_identity()
False
```

# list()

Returns a list of two list that represents the permutation.

#### **EXAMPLES:**

```
sage: p = iet.GeneralizedPermutation('a b','b a',reduced=True)
sage: p.list() == [p[0], p[1]]
True
sage: p.list() == [['a', 'b'], ['b', 'a']]
True

sage: p = iet.GeneralizedPermutation('a b c', 'b c a',reduced=True)
sage: iet.GeneralizedPermutation(p.list(),reduced=True) == p
True
```

# rauzy\_diagram(\*\*kargs)

Returns the associated Rauzy diagram.

#### **OUTPUT:**

A Rauzy diagram

#### **EXAMPLES:**

```
sage: p = iet.Permutation('a b c d', 'd a b c', reduced=True)
sage: d = p.rauzy_diagram()
sage: p.rauzy_move(0) in d
True
sage: p.rauzy_move(1) in d
True
```

For more information, try help RauzyDiagram

# rauzy\_move\_relabel (winner, side='right')

Returns the relabelization obtained from this move.

```
sage: p = iet.Permutation('a b c d','d c b a')
sage: q = p.reduced()
sage: p_t = p.rauzy_move('t')
sage: q_t = q.rauzy_move('t')
sage: s_t = q.rauzy_move_relabel('t')
sage: s_t
WordMorphism: a->a, b->b, c->c, d->d
sage: map(s_t, p_t[0]) == map(Word, q_t[0])
True
sage: map(s_t, p_t[1]) == map(Word, q_t[1])
True
sage: p_b = p.rauzy_move('b')
sage: q_b = q.rauzy_move('b')
sage: s_b = q.rauzy_move_relabel('b')
sage: s_b
```

```
WordMorphism: a->a, b->d, c->b, d->c
        sage: map(s_b, q_b[0]) == map(Word, p_b[0])
         sage: map(s_b, q_b[1]) == map(Word, p_b[1])
         True
class sage.dynamics.interval_exchanges.reduced.ReducedPermutationLI (intervals=None,
                                                                           alpha-
                                                                           bet=None)
    Bases:
                     sage.dynamics.interval_exchanges.reduced.ReducedPermutation,
    sage.dynamics.interval_exchanges.template.PermutationLI
    Reduced quadratic (or generalized) permutation.
    EXAMPLES:
    Reducibility testing:
    sage: p = iet.GeneralizedPermutation('a b b', 'c c a', reduced = True)
    sage: p.is_irreducible()
    True
    sage: p = iet.GeneralizedPermutation('a b c a', 'b d d c', reduced = True)
    sage: p.is_irreducible()
    False
    sage: test, decomposition = p.is_irreducible(return_decomposition = True)
    sage: test
    False
    sage: decomposition
     (['a'], ['c', 'a'], [], ['c'])
    Rauzy movavability and Rauzy move:
    sage: p = iet.GeneralizedPermutation('a b b', 'c c a', reduced = True)
    sage: p.has_rauzy_move(0)
    True
    sage: p.rauzy_move(0)
    a a b b
    СС
    sage: p.rauzy_move(0).has_rauzy_move(0)
    sage: p.rauzy_move(1)
    a b b
    сса
    Rauzy diagrams:
    sage: p_red = iet.GeneralizedPermutation('a b b', 'c c a', reduced = True)
    sage: d_red = p_red.rauzy_diagram()
    sage: d_red.cardinality()
    list()
        The permutations as a list of two lists.
        EXAMPLES:
         sage: p = iet.GeneralizedPermutation('a b b', 'c c a', reduced = True)
         sage: list(p)
         [['a', 'b', 'b'], ['c', 'c', 'a']]
```

```
rauzy_diagram(**kargs)
          Returns the associated Rauzy diagram.
          The Rauzy diagram of a permutation corresponds to all permutations that we could obtain from this one
          by Rauzy move. The set obtained is a labelled Graph. The label of vertices being 0 or 1 depending on the
          type.
          OUTPUT:
          Rauzy diagram – the graph of permutations obtained by rauzy induction
          EXAMPLES:
          sage: p = iet.Permutation('a b c d', 'd a b c')
          sage: d = p.rauzy_diagram()
sage.dynamics.interval_exchanges.reduced.ReducedPermutationsIET_iterator(nintervals=None,
                                                                                             ir-
                                                                                             re-
                                                                                             ducible=True,
                                                                                             al-
                                                                                             pha-
                                                                                             bet=None)
     Returns an iterator over reduced permutations
     INPUT:
         •nintervals - integer or None
         •irreducible - boolean
         •alphabet - something that should be converted to an alphabet of at least nintervals letters
     TESTS:
     sage: for p in iet.Permutations_iterator(3, reduced=True, alphabet="abc"):
                print p #indirect doctest
     a b c
     b c a
     a b c
     cab
     a b c
     c b a
class sage.dynamics.interval exchanges.reduced.ReducedRauzyDiagram(p,
                                                                                   right_induction=True,
```

*left induction=False*, *left\_right\_inversion=False*, top\_bottom\_inversion=False, svmmetric=False)

Bases: sage.dynamics.interval\_exchanges.template.RauzyDiagram

Rauzy diagram of reduced permutations

```
sage.dynamics.interval_exchanges.reduced.alphabetized_atwin(twin, alphabet)
    Alphabetization of a twin of iet.
```

# TESTS:

```
sage: from sage.dynamics.interval_exchanges.reduced import alphabetized_atwin
```

```
sage: twin = [[0,1],[0,1]]
    sage: alphabet = Alphabet("ab")
    sage: alphabetized_atwin(twin, alphabet)

    sage: alphabet=Alphabet("abc")
    sage: print alphabetized_qtwin(twin,alphabet)
    [['a', 'b', 'a'], ['c', 'b', 'c']]
sage.dynamics.interval_exchanges.reduced.labelize_flip(couple)
    Returns a string from a 2-uple couple of the form (name, flip).
    sage: from sage.dynamics.interval_exchanges.reduced import labelize_flip
    sage: labelize_flip((4,1))
     , 4,
    sage: labelize_flip(('a',-1))
```

# 1.4 Permutations template

This file define high level operations on permutations (alphabet, the different rauzy induction, ...) shared by reduced and labeled permutations.

#### **AUTHORS:**

• Vincent Delecroix (2008-12-20): initial version

# Todo

- construct as options different string representations for a permutation
  - the two intervals: str
  - the two intervals on one line: str\_one\_line
  - the separatrix diagram: str\_separatrix\_diagram
  - twin[0] and twin[1] for reduced permutation
  - nothing (useful for Rauzy diagram)

```
class sage.dynamics.interval_exchanges.template.FlippedPermutation
    Bases: sage.dynamics.interval_exchanges.template.Permutation
```

Template for flipped generalized permutations.

```
Warning: Internal class! Do not use directly!
```

# **AUTHORS:**

•Vincent Delecroix (2008-12-20): initial version

```
str (sep='n')
```

String representation.

#### TESTS:

```
sage: p = iet.GeneralizedPermutation('a a','b b',flips='a')
sage: print p.str()
-a -a
b b
sage: print p.str('/')
-a -a/b b
```

class sage.dynamics.interval\_exchanges.template.FlippedPermutationIET

```
\begin{tabular}{ll} \textbf{Bases:} & \texttt{sage.dynamics.interval\_exchanges.template.FlippedPermutation,} \\ \texttt{sage.dynamics.interval\_exchanges.template.PermutationIET} \\ \end{tabular}
```

Template for flipped Abelian permutations.

```
Warning: Internal class! Do not use directly!
```

#### **AUTHORS:**

•Vincent Delecroix (2008-12-20): initial version

```
flips()
```

Returns the list of flips.

## **EXAMPLES:**

```
sage: p = iet.Permutation('a b c','c b a',flips='ac')
sage: p.flips()
['a', 'c']
```

class sage.dynamics.interval\_exchanges.template.FlippedPermutationLI

Bases: sage.dynamics.interval\_exchanges.template.FlippedPermutation, sage.dynamics.interval\_exchanges.template.PermutationLI

Template for flipped quadratic permutations.

```
Warning: Internal class! Do not use directly!
```

#### **AUTHORS:**

•Vincent Delecroix (2008-12-20): initial version

#### flips()

Returns the list of flipped intervals.

#### **EXAMPLES:**

```
sage: p = iet.GeneralizedPermutation('a a','b b',flips='a')
sage: p.flips()
['a']
sage: p = iet.GeneralizedPermutation('a a','b b',flips='b',reduced=True)
sage: p.flips()
['b']
```

 ${f class}$  sage.dynamics.interval\_exchanges.template. ${f FlippedRauzyDiagram}\,(p,$ 

right\_induction=True, left\_induction=False, left\_right\_inversion=False, top\_bottom\_inversion=False, symmetric=False)

Bases: sage.dynamics.interval\_exchanges.template.RauzyDiagram

Template for flipped Rauzy diagrams.

```
Warning: Internal class! Do not use directly!
```

#### **AUTHORS:**

•Vincent Delecroix (2009-09-29): initial version

```
complete(p, reducible=False)
```

Completion of the Rauzy diagram

Add all successors of p for defined operations in edge\_types. Could be used for generating non (strongly) connected Rauzy diagrams. Sometimes, for flipped permutations, the maximal connected graph in all permutations is not strongly connected. Finding such components needs to call most than once the .complete() method.

# INPUT:

- •p a permutation
- •reducible put or not reducible permutations

### **EXAMPLES:**

```
sage: p = iet.Permutation('a b c','c b a',flips='a')
sage: d = p.rauzy_diagram()
sage: d
Rauzy diagram with 3 permutations
sage: p = iet.Permutation('a b c','c b a',flips='b')
sage: d.complete(p)
sage: d
Rauzy diagram with 8 permutations
sage: p = iet.Permutation('a b c','c b a',flips='a')
sage: d.complete(p)
sage: d
Rauzy diagram with 8 permutations
```

class sage.dynamics.interval\_exchanges.template.Permutation

Bases: sage.structure.sage\_object.SageObject

Template for all permutations.

```
Warning: Internal class! Do not use directly!
```

This class implement generic algorithm (stratum, connected component, ...) and unfies all its children.

# alphabet (data=None)

Manages the alphabet of self.

If there is no argument, the method returns the alphabet used. If the argument could be converted to an alphabet, this alphabet will be used.

## INPUT:

•data - None or something that could be converted to an alphabet

### **OUTPUT**:

- either None or the current alphabet

# **EXAMPLES:**

```
sage: p = iet.Permutation('a b','a b')
sage: p.alphabet([0,1])
sage: p.alphabet() == Alphabet([0,1])
True
sage: p
0 1
0 1
sage: p.alphabet("cd")
sage: p.alphabet() == Alphabet(['c','d'])
True
sage: p
c d
c d
```

# has\_rauzy\_move (winner='top', side=None)

Tests the legality of a Rauzy move.

## INPUT:

```
•winner - 'top' or 'bottom' corresponding to the interval
```

```
•side - 'left' or 'right' (defaut)
```

```
OUTPUT:
    - a boolean
    EXAMPLES:
    sage: p = iet.Permutation('a b','a b')
    sage: p.has_rauzy_move('top','right')
    False
    sage: p.has_rauzy_move('bottom','right')
    False
    sage: p.has_rauzy_move('top','left')
    sage: p.has_rauzy_move('bottom','left')
    False
    sage: p = iet.Permutation('a b c','b a c')
    sage: p.has_rauzy_move('top','right')
    False
    sage: p.has_rauzy_move('bottom', 'right')
    False
    sage: p.has_rauzy_move('top','left')
    sage: p.has_rauzy_move('bottom','left')
    sage: p = iet.Permutation('a b','b a')
    sage: p.has_rauzy_move('top','right')
    True
    sage: p.has_rauzy_move('bottom','right')
    True
    sage: p.has_rauzy_move('top','left')
    sage: p.has_rauzy_move('bottom','left')
    True
horizontal_inverse()
    Returns the top-bottom inverse.
    You can use also use the shorter .tb_inverse().
    OUTPUT:
    - a permutation
    EXAMPLES:
    sage: p = iet.Permutation('a b','b a')
    sage: p.top_bottom_inverse()
    b a
    a b
    sage: p = iet.Permutation('a b','b a', reduced=True)
    sage: p.top_bottom_inverse() == p
    sage: p = iet.Permutation('a b c d','c d a b')
    sage: p.top_bottom_inverse()
    cdab
    abcd
```

TESTS:

```
sage: p = iet.Permutation('a b','a b')
    sage: p == p.top_bottom_inverse()
    True
    sage: p is p.top_bottom_inverse()
    False
    sage: p = iet.GeneralizedPermutation('a a','b b',reduced=True)
    sage: p == p.top_bottom_inverse()
    sage: p is p.top_bottom_inverse()
    False
left_right_inverse()
    Returns the left-right inverse.
    You can also use the shorter .lr inverse()
    OUTPUT:
    - a permutation
    EXAMPLES:
    sage: p = iet.Permutation('a b c','c a b')
    sage: p.left_right_inverse()
    c b a
    bac
    sage: p = iet.Permutation('a b c d','c d a b')
    sage: p.left_right_inverse()
    dcba
    badc
    sage: p = iet.GeneralizedPermutation('a a','b b c c')
    sage: p.left_right_inverse()
    аа
    ccbb
    sage: p = iet.Permutation('a b c','c b a', reduced=True)
    sage: p.left_right_inverse() == p
    sage: p = iet.Permutation('a b c','c a b',reduced=True)
    sage: q = p.left_right_inverse()
    sage: q == p
    False
    sage: q
    a b c
    b c a
    sage: p = iet.GeneralizedPermutation('a a','b b c c',reduced=True)
    sage: p.left_right_inverse() == p
    sage: p = iet.GeneralizedPermutation('a b b','c c a',reduced=True)
    sage: q = p.left_right_inverse()
    sage: q == p
    False
    sage: q
    a a b
    bсс
    TESTS:
```

```
sage: p = iet.GeneralizedPermutation('a a','b b')
    sage: p.left_right_inverse()
    аа
    b b
    sage: p is p.left_right_inverse()
    sage: p == p.left_right_inverse()
    True
letters()
    Returns the list of letters of the alphabet used for representation.
    The letters used are not necessarily the whole alphabet (for example if the alphabet is infinite).
    OUTPUT:
    - a list of labels
    EXAMPLES:
    sage: p = iet.Permutation([1,2],[2,1])
    sage: p.alphabet(Alphabet(name="NN"))
    sage: p
    0 1
    1 0
    sage: p.letters()
    [0, 1]
lr_inverse()
    Returns the left-right inverse.
    You can also use the shorter .lr_inverse()
    OUTPUT:
    - a permutation
    EXAMPLES:
    sage: p = iet.Permutation('a b c','c a b')
    sage: p.left_right_inverse()
    c b a
    bac
    sage: p = iet.Permutation('a b c d','c d a b')

    sage: p = iet.GeneralizedPermutation('a a','b b c c')
    sage: p.left_right_inverse()
    аа
    ccbb
    sage: p = iet.Permutation('a b c','c b a',reduced=True)
    sage: p.left_right_inverse() == p
    sage: p = iet.Permutation('a b c','c a b',reduced=True)
    sage: q = p.left_right_inverse()
    sage: q == p
    False
```

sage: q

```
a b c
bса
sage: p = iet.GeneralizedPermutation('a a','b b c c', reduced=True)
sage: p.left_right_inverse() == p
True
sage: p = iet.GeneralizedPermutation('a b b','c c a',reduced=True)
sage: q = p.left_right_inverse()
sage: q == p
False
sage: q
a a b
b c c
TESTS:
sage: p = iet.GeneralizedPermutation('a a','b b')
sage: p.left_right_inverse()
b b
sage: p is p.left_right_inverse()
False
sage: p == p.left_right_inverse()
True
```

#### rauzy\_move (winner, side='right', iteration=1)

Returns the permutation after a Rauzy move.

# INPUT:

- •winner 'top' or 'bottom' interval
- •side 'right' or 'left' (defaut: 'right') corresponding to the side on which the Rauzy move must be performed.
- •iteration a non negative integer

# **OUTPUT**:

•a permutation

#### TESTS:

```
sage: p = iet.Permutation('a b','b a')
sage: p.rauzy_move(winner=0, side='right') == p
True
sage: p.rauzy_move(winner=1, side='right') == p
True
sage: p.rauzy_move(winner=0, side='left') == p
True
sage: p.rauzy_move(winner=1, side='left') == p
True
sage: p.rauzy_move(winner=1, side='left') == p
True
sage: p = iet.Permutation('a b c','c b a')
sage: p.rauzy_move(winner=0, side='right')
a b c
c a b
sage: p.rauzy_move(winner=1, side='right')
a c b
c b a
sage: p.rauzy_move(winner=0, side='left')
a b c
```

```
b c a
    sage: p.rauzy_move(winner=1, side='left')
    b a c
    c b a
str (sep='n')
    A string representation of the generalized permutation.
    INPUT:
       •sep - (default: 'n') a separator for the two intervals
    OUTPUT:
    string - the string that represents the permutation
    EXAMPLES:
    For permutations of iet:
    sage: p = iet.Permutation('a b c','c b a')
    sage: p.str()
    'a b c\nc b a'
    sage: p.str(sep=' | ')
    'abc|cba'
    ..the permutation can be rebuilt from the standard string:
    sage: p == iet.Permutation(p.str())
    True
    For permutations of li:
    sage: p = iet.GeneralizedPermutation('a b b','c c a')
    sage: p.str()
    'a b b\nc c a'
    sage: p.str(sep=' | ')
    'abb|cca'
    ..the generalized permutation can be rebuilt from the standard string:
    sage: p == iet.GeneralizedPermutation(p.str())
    True
symmetric()
    Returns the symmetric permutation.
    The symmetric permutation is the composition of the top-bottom inversion and the left-right inversion
    (which are geometrically orientation reversing).
    OUTPUT:
    - a permutation
    EXAMPLES:
    sage: p = iet.Permutation("a b c", "c b a")
    sage: p.symmetric()
    a b c
    c b a
    sage: q = iet.Permutation("a b c d", "b d a c")
```

sage: q.symmetric()

```
cadb
    dcba
    sage: p = iet.Permutation('a b c d','c a d b')
    sage: q = p.symmetric()
    sage: q1 = p.tb_inverse().lr_inverse()
    sage: q2 = p.lr_inverse().tb_inverse()
    sage: q == q1
    True
    sage: q == q2
    True
    TESTS:
    sage: p = iet.GeneralizedPermutation('a a b','b c c',reduced=True)
    sage: q = p.symmetric()
    sage: q1 = p.tb_inverse().lr_inverse()
    sage: q2 = p.lr_inverse().tb_inverse()
    sage: q == q1
    True
    sage: q == q2
    True
    sage: p = iet.GeneralizedPermutation('a a b','b c c',reduced=True,flips='a')
    sage: q = p.symmetric()
    sage: q1 = p.tb_inverse().lr_inverse()
    sage: q2 = p.lr_inverse().tb_inverse()
    sage: q == q1
    True
    sage: q == q2
    True
tb_inverse()
    Returns the top-bottom inverse.
    You can use also use the shorter .tb_inverse().
    OUTPUT:
    - a permutation
    EXAMPLES:
    sage: p = iet.Permutation('a b','b a')
    sage: p.top_bottom_inverse()
    b a
    a b
    sage: p = iet.Permutation('a b','b a', reduced=True)
    sage: p.top_bottom_inverse() == p
    True
    sage: p = iet.Permutation('a b c d','c d a b')
    sage: p.top_bottom_inverse()
    cdab
    abcd
    TESTS:
    sage: p = iet.Permutation('a b','a b')
    sage: p == p.top_bottom_inverse()
    True
```

```
sage: p is p.top_bottom_inverse()
    False
    sage: p = iet.GeneralizedPermutation('a a','b b', reduced=True)
    sage: p == p.top_bottom_inverse()
    sage: p is p.top_bottom_inverse()
    False
top_bottom_inverse()
    Returns the top-bottom inverse.
    You can use also use the shorter .tb inverse().
    OUTPUT:
    - a permutation
    EXAMPLES:
    sage: p = iet.Permutation('a b','b a')
    sage: p.top_bottom_inverse()
    b a
    a b
    sage: p = iet.Permutation('a b','b a', reduced=True)
    sage: p.top_bottom_inverse() == p
    True
    sage: p = iet.Permutation('a b c d','c d a b')
    sage: p.top_bottom_inverse()
    cdab
    abcd
    TESTS:
    sage: p = iet.Permutation('a b','a b')
    sage: p == p.top_bottom_inverse()
    True
    sage: p is p.top_bottom_inverse()
    False
    sage: p = iet.GeneralizedPermutation('a a','b b', reduced=True)
    sage: p == p.top_bottom_inverse()
    sage: p is p.top_bottom_inverse()
    False
vertical inverse()
    Returns the left-right inverse.
    You can also use the shorter .lr_inverse()
    OUTPUT:
    - a permutation
    EXAMPLES:
    sage: p = iet.Permutation('a b c','c a b')
    sage: p.left_right_inverse()
    c b a
    bac
    sage: p = iet.Permutation('a b c d','c d a b')
    sage: p.left_right_inverse()
```

```

class sage.dynamics.interval\_exchanges.template.PermutationIET

Bases: sage.dynamics.interval\_exchanges.template.Permutation

Template for permutation from Interval Exchange Transformation.

```
Warning: Internal class! Do not use directly!
```

**AUTHOR:** 

•Vincent Delecroix (2008-12-20): initial version

```
arf invariant()
```

Returns the Arf invariant of the suspension of self.

OUTPUT:

integer -0 or 1

Permutations from the odd and even component of H(2,2,2):

```
sage: a = range(10)
sage: b1 = [3,2,4,6,5,7,9,8,1,0]
sage: b0 = [6,5,4,3,2,7,9,8,1,0]
sage: p1 = iet.Permutation(a,b1)
sage: print p1.arf_invariant()
1
sage: p0 = iet.Permutation(a,b0)
sage: print p0.arf_invariant()
```

Permutations from the odd and even component of H(4,4):

```
sage: a = range(11)
sage: b1 = [3,2,5,4,6,8,7,10,9,1,0]
sage: b0 = [5,4,3,2,6,8,7,10,9,1,0]
sage: p1 = iet.Permutation(a,b1)
sage: print p1.arf_invariant()
1
sage: p0 = iet.Permutation(a,b0)
sage: print p0.arf_invariant()
0
```

# attached\_in\_degree()

Returns the degree of the singularity at the right of the interval.

#### **OUTPUT**:

- a positive integer

#### **EXAMPLES**:

```
sage: p1 = iet.Permutation('a b c d e f g','d c g f e b a')
sage: p2 = iet.Permutation('a b c d e f g','e d c g f b a')
sage: p1.attached_in_degree()
1
sage: p2.attached_in_degree()
3
```

# attached\_out\_degree()

Returns the degree of the singularity at the left of the interval.

#### **OUTPUT**:

- a positive integer

```
sage: p1 = iet.Permutation('a b c d e f g','d c g f e b a')
sage: p2 = iet.Permutation('a b c d e f g','e d c g f b a')
sage: p1.attached_out_degree()
3
sage: p2.attached_out_degree()
```

#### attached\_type()

Return the singularity degree attached on the left and the right.

#### **OUTPUT**:

```
([degre], angle_parity) - if the same singularity is attached on the left and right
```

([left\_degree, right\_degree], 0) - the degrees at the left and the right which are different singularities

#### **EXAMPLES:**

# With two intervals:

```
sage: p = iet.Permutation('a b','b a')
sage: p.attached_type()
([0], 1)
```

#### With three intervals:

```
sage: p = iet.Permutation('a b c','b c a')
sage: p.attached_type()
([0], 1)

sage: p = iet.Permutation('a b c','c a b')
sage: p.attached_type()
([0], 1)

sage: p = iet.Permutation('a b c','c b a')
sage: p.attached_type()
([0, 0], 0)
```

### With four intervals:

```
sage: p = iet.Permutation('1 2 3 4','4 3 2 1')
sage: p.attached_type()
([2], 0)
```

# connected\_component (marked\_separatrix='no')

Returns a connected components of a stratum.

# **EXAMPLES:**

Permutations from the stratum H(6):

```
sage: a = range(8)
sage: b_hyp = [7,6,5,4,3,2,1,0]
sage: b_odd = [3,2,5,4,7,6,1,0]
sage: b_even = [5,4,3,2,7,6,1,0]
sage: p_hyp = iet.Permutation(a, b_hyp)
sage: p_odd = iet.Permutation(a, b_odd)
sage: p_even = iet.Permutation(a, b_even)
sage: print p_hyp.connected_component()
H_hyp(6)
sage: print p_odd.connected_component()
H_odd(6)
sage: print p_even.connected_component()
H_even(6)
```

# Permutations from the stratum H(4,4):

```
sage: a = range(11)
sage: b_hyp = [10,9,8,7,6,5,4,3,2,1,0]
```

```
sage: b_odd = [3,2,5,4,6,8,7,10,9,1,0]
sage: b_even = [5,4,3,2,6,8,7,10,9,1,0]
sage: p_hyp = iet.Permutation(a,b_hyp)
sage: p_odd = iet.Permutation(a,b_odd)
sage: p_even = iet.Permutation(a,b_even)
sage: p_hyp.stratum() == AbelianStratum(4,4)
True
sage: print p_hyp.connected_component()
H_hyp(4, 4)
sage: p_odd.stratum() == AbelianStratum(4,4)
True
sage: print p_odd.connected_component()
H_odd(4, 4)
sage: p_even.stratum() == AbelianStratum(4,4)
True
sage: print p_even.connected_component()
H_odd(4, 4)
```

As for stratum you can specify that you want to attach the singularity on the left of the interval using the option marked\_separatrix:

```
sage: a = [1, 2, 3, 4, 5, 6, 7, 8, 9]
sage: b4\_odd = [4,3,6,5,7,9,8,2,1]
sage: b4_{even} = [6, 5, 4, 3, 7, 9, 8, 2, 1]
sage: b2\_odd = [4,3,5,7,6,9,8,2,1]
sage: b2_{even} = [7, 6, 5, 4, 3, 9, 8, 2, 1]
sage: p4_odd = iet.Permutation(a,b4_odd)
sage: p4_even = iet.Permutation(a,b4_even)
sage: p2_odd = iet.Permutation(a,b2_odd)
sage: p2_even = iet.Permutation(a,b2_even)
sage: p4_odd.connected_component(marked_separatrix='out')
H \text{ odd}^\circ \text{out}(4, 2)
sage: p4_even.connected_component(marked_separatrix='out')
H_{even}^{out}(4, 2)
sage: p2_odd.connected_component(marked_separatrix='out')
H_odd^out(2, 4)
sage: p2_even.connected_component (marked_separatrix='out')
H_{even}^{out}(2, 4)
sage: p2_odd.connected_component() == p4_odd.connected_component()
sage: p2_odd.connected_component('out') == p4_odd.connected_component('out')
False
```

### cylindric()

True

Returns a permutation in the Rauzy class such that

twin[0][-1] == 0 twin[1][-1] == 0

```
TESTS:
sage: p = iet.Permutation('a b c','c b a')
sage: p.cylindric() == p
True
sage: p = iet.Permutation('a b c d','b d a c')
sage: q = p.cylindric()
sage: q[0][0] == q[1][-1]
True
sage: q[1][0] == q[1][0]
```

#### decompose()

Returns the decomposition of self.

#### **OUTPUT**:

- a list of permutations

# **EXAMPLES:**

```
sage: p = iet.Permutation('a b c','c b a').decompose()[0]
sage: p
a b c
c b a

sage: p1,p2,p3 = iet.Permutation('a b c d e','b a c e d').decompose()
sage: p1
a b
b a
sage: p2
c
c
sage: p3
d e
e d
```

# erase\_marked\_points()

Returns a permutation equivalent to self but without marked points.

#### **EXAMPLES:**

```
sage: a = iet.Permutation('a b1 b2 c d', 'd c b1 b2 a')
sage: a.erase_marked_points()
a b1 c d
d c b1 a
```

#### genus()

Returns the genus corresponding to any suspension of the permutation.

# OUTPUT:

- a positive integer

### **EXAMPLES**:

```
sage: p = iet.Permutation('a b c', 'c b a')
sage: p.genus()
1
sage: p = iet.Permutation('a b c d','d c b a')
sage: p.genus()
2
```

# **REFERENCES:** Veech

# intersection\_matrix()

Returns the intersection matrix.

This d \* d antisymmetric matrix is given by the rule :

$$m_{ij} = \begin{cases} 1 & i < j \text{ and } \pi(i) > \pi(j) \\ -1 & i > j \text{ and } \pi(i) < \pi(j) \\ 0 & \text{else} \end{cases}$$

#### **OUTPUT**:

#### •a matrix

# **EXAMPLES:**

```
sage: p = iet.Permutation('a b c d','d c b a')
sage: p.intersection_matrix()
[ 0  1  1  1]
[-1  0  1  1]
[-1 -1  0  1]
[-1 -1 -1  0]

sage: p = iet.Permutation('1  2  3  4  5','5  3  2  4  1')
sage: p.intersection_matrix()
[ 0  1  1  1  1]
[-1  0  1  0  1]
[-1 -1  0  0  0  1]
[-1 -1  0  0  0  1]
[-1 -1 -1 -1 -1  0]
```

# is\_cylindric()

Returns True if the permutation is Rauzy\_1n.

A permutation is cylindric if 1 and n are exchanged.

#### **EXAMPLES:**

```
sage: iet.Permutation('1 2 3','3 2 1').is_cylindric()
True
sage: iet.Permutation('1 2 3','2 1 3').is_cylindric()
False
```

# is\_hyperelliptic()

Returns True if the permutation is in the class of the symmetric permutations (with eventual marked points).

This is equivalent to say that the suspension lives in an hyperelliptic stratum of Abelian differentials  $H_hyp(2g-2)$  or  $H_hyp(g-1, g-1)$  with some marked points.

### **EXAMPLES:**

```
sage: iet.Permutation('a b c d','d c b a').is_hyperelliptic()
True
sage: iet.Permutation('0 1 2 3 4 5','5 2 1 4 3 0').is_hyperelliptic()
False
```

# **REFERENCES:**

# is\_irreducible (return\_decomposition=False)

Tests the irreducibility.

An abelian permutation p = (p0,p1) is reducible if: set(p0[:i]) = set(p1[:i]) for an i < len(p0)

# **OUTPUT**:

•a boolean

```
sage: p = iet.Permutation('a b c', 'c b a')
    sage: p.is_irreducible()
    True
    sage: p = iet.Permutation('a b c', 'b a c')
    sage: p.is_irreducible()
    False
order_of_rauzy_action (winner, side=None)
    Returns the order of the action of a Rauzy move.
    INPUT:
       •winner - string 'top' or 'bottom'
       •side - string 'left' or 'right'
    OUTPUT:
    An integer corresponding to the order of the Rauzy action.
    EXAMPLES:
    sage: p = iet.Permutation('a b c d','d a c b')
    sage: p.order_of_rauzy_action('top', 'right')
    sage: p.order_of_rauzy_action('bottom', 'right')
    sage: p.order_of_rauzy_action('top', 'left')
    sage: p.order_of_rauzy_action('bottom', 'left')
separatrix diagram(side=False)
    Returns the separatrix diagram of the permutation.
    INPUT:
       •side - boolean
    OUTPUT:
    - a list of lists
    EXAMPLES:
    sage: iet.Permutation([0, 1], [1, 0]).separatrix_diagram()
    [[(1, 0), (1, 0)]]
    sage: iet.Permutation('a b c d','d c b a').separatrix_diagram()
    [[('d', 'a'), 'b', 'c', ('d', 'a'), 'b', 'c']]
stratum (marked_separatrix='no')
    Returns the strata in which any suspension of this permutation lives.
    OUTPUT:
       •a stratum of Abelian differentials
    EXAMPLES:
    sage: p = iet.Permutation('a b c', 'c b a')
    sage: print p.stratum()
    H(0, 0)
```

```
sage: p = iet.Permutation('a b c d', 'd a b c')
sage: print p.stratum()
H(0, 0, 0)

sage: p = iet.Permutation(range(9), [8,5,2,7,4,1,6,3,0])
sage: print p.stratum()
H(1, 1, 1, 1)
```

You can specify that you want to attach the singularity on the left (or on the right) with the option marked\_separatrix:

```
sage: a = 'a b c d e f g h i j'
sage: b3 = 'd c g f e j i h b a'
sage: b2 = 'd c e g f j i h b a'
sage: b1 = 'e d c g f h j i b a'
sage: p3 = iet.Permutation(a, b3)
sage: p3.stratum()
H(3, 2, 1)
sage: p3.stratum(marked_separatrix='out')
H^{out}(3, 2, 1)
sage: p2 = iet.Permutation(a, b2)
sage: p2.stratum()
H(3, 2, 1)
sage: p2.stratum(marked_separatrix='out')
H^{out}(2, 3, 1)
sage: p1 = iet.Permutation(a, b1)
sage: p1.stratum()
H(3, 2, 1)
sage: p1.stratum(marked_separatrix='out')
H^{out}(1, 3, 2)
```

### **AUTHORS:**

• Vincent Delecroix (2008-12-20)

# to\_permutation()

Returns the permutation as an element of the symmetric group.

#### **EXAMPLES:**

```
sage: p = iet.Permutation('a b c','c b a')
sage: p.to_permutation()
[3, 2, 1]

sage: p = Permutation([2,4,1,3])
sage: q = iet.Permutation(p)
sage: q.to_permutation() == p
True
```

class sage.dynamics.interval\_exchanges.template.PermutationLI

Bases: sage.dynamics.interval\_exchanges.template.Permutation

Template for quadratic permutation.

```
Warning: Internal class! Do not use directly!
```

**AUTHOR:** 

•Vincent Delecroix (2008-12-20): initial version

#### has\_right\_rauzy\_move (winner)

Test of Rauzy movability (with an eventual specified choice of winner)

A quadratic (or generalized) permutation is rauzy\_movable type depending on the possible length of the last interval. It's dependent of the length equation.

#### INPUT:

•winner - the integer 'top' or 'bottom'

#### **EXAMPLES:**

```
sage: p = iet.GeneralizedPermutation('a a','b b')
sage: p.has_right_rauzy_move('top')
False
sage: p.has_right_rauzy_move('bottom')
False

sage: p = iet.GeneralizedPermutation('a a b','b c c')
sage: p.has_right_rauzy_move('top')
True
sage: p.has_right_rauzy_move('bottom')
True

sage: p = iet.GeneralizedPermutation('a a','b b c c')
sage: p.has_right_rauzy_move('top')
True

sage: p.has_right_rauzy_move('bottom')
False

sage: p = iet.GeneralizedPermutation('a a b b','c c')
sage: p.has_right_rauzy_move('top')
False

sage: p.has_right_rauzy_move('top')
False
sage: p.has_right_rauzy_move('bottom')
```

# is\_irreducible (return\_decomposition=False)

Test of reducibility

A quadratic (or generalized) permutation is *reducible* if there exists a decomposition

$$A1uB1|...|B1uA2$$
  
 $A1uB2|...|B2uA2$ 

where no corners is empty, or exactly one corner is empty and it is on the left, or two and they are both on the right or on the left. The definition is due to [BL08] where they prove that the property of being irreducible is stable under Rauzy induction.

# INPUT:

•return\_decomposition - boolean (default: False) - if True, and the permutation is reducible, returns also the blocs A1 u B1, B1 u A2, A1 u B2 and B2 u A2 of a decomposition as above.

#### **OUTPUT:**

If return\_decomposition is True, returns a 2-uple (test,decomposition) where test is the preceding test and decomposition is a 4-uple (A11,A12,A21,A22) where:

```
A11 = A1 u B1 A12 = B1 u A2 A21 = A1 u B2 A22 = B2 u A2
```

```
sage: GP = iet.GeneralizedPermutation
         sage: GP('a a','b b').is_irreducible()
         False
         sage: GP('a a b','b c c').is_irreducible()
         sage: GP('1 2 3 4 5 1','5 6 6 4 3 2').is_irreducible()
         TESTS:
         Test reducible permutations with no empty corner:
         sage: GP('1 4 1 3','4 2 3 2').is_irreducible(True)
         (False, (['1', '4'], ['1', '3'], ['4', '2'], ['3', '2']))
         Test reducible permutations with one left corner empty:
         sage: GP('1 2 2 3 1','4 4 3').is_irreducible(True)
         (False, (['1'], ['3', '1'], [], ['3']))
         sage: GP('4 4 3','1 2 2 3 1').is_irreducible(True)
         (False, ([], ['3'], ['1'], ['3', '1']))
         Test reducible permutations with two left corners empty:
         sage: GP('1 1 2 3','4 2 4 3').is_irreducible(True)
         (False, ([], ['3'], [], ['3']))
         Test reducible permutations with two right corners empty:
         sage: GP('1 2 2 3 3','1 4 4').is_irreducible(True)
         (False, (['1'], [], ['1'], []))
         sage: GP('1 2 2','1 3 3').is_irreducible(True)
         (False, (['1'], [], ['1'], []))
         sage: GP('1 2 3 3','2 1 4 4 5 5').is_irreducible(True)
         (False, (['1', '2'], [], ['2', '1'], []))

class Path (parent, \*data)

Bases: sage.structure.sage\_object.SageObject

Path in Rauzy diagram.

A path in a Rauzy diagram corresponds to a subsimplex of the simplex of lengths. This correspondance is obtained via the Rauzy induction. To a idoc IET we can associate a unique path in a Rauzy diagram. This establishes a correspondance between infinite full path in Rauzy diagram and equivalence topologic class of IET.

```
append (edge_type)
```

Append an edge to the path.

#### **EXAMPLES**:

```
sage: p = iet.Permutation('a b c','c b a')
sage: r = p.rauzy_diagram()
sage: g = r.path(p)
sage: g.append('top')
sage: g
Path of length 1 in a Rauzy diagram
sage: g.append('bottom')
sage: g
Path of length 2 in a Rauzy diagram
```

### composition (function, composition=None)

Compose an edges function on a path

#### INPUT:

- •path either a Path or a tuple describing a path
- •function function must be of the form
- •composition the composition function

## **AUTHOR:**

•Vincent Delecroix (2009-09-29)

#### **EXAMPLES:**

# edge\_types()

Returns the edge types of the path.

# **EXAMPLES:**

```
sage: p = iet.Permutation('a b c','c b a')
sage: r = p.rauzy_diagram()
sage: g = r.path(p, 0, 1)
sage: g.edge_types()
[0, 1]
```

# end()

Returns the last vertex of the path.

```
sage: p = iet.Permutation('a b c','c b a')
sage: r = p.rauzy_diagram()
sage: g1 = r.path(p, 't', 'b', 't')
sage: g1.end() == p
```

```
sage: g2 = r.path(p, 'b', 't', 'b')
   sage: g2.end() == p
   True
extend (path)
   Extends self with another path.
   EXAMPLES:
   sage: p = iet.Permutation('a b c d','d c b a')
   sage: r = p.rauzy_diagram()
   sage: g1 = r.path(p,'t','t')
   sage: q2 = r.path(p.rauzy_move('t',iteration=2),'b','b')
   sage: g = r.path(p,'t','t','b','b')
   sage: g == g1 + g2
   True
   sage: g = copy(g1)
   sage: g.extend(g2)
   sage: q == q1 + q2
   True
is_loop()
   Tests whether the path is a loop (start point = end point).
   EXAMPLES:
   sage: p = iet.Permutation('a b','b a')
   sage: r = p.rauzy_diagram()
   sage: r.path(p).is_loop()
   True
   sage: r.path(p, 0, 1, 0, 0) .is_loop()
   True
losers()
   Returns a list of the loosers on the path.
   EXAMPLES:
   sage: p = iet.Permutation('a b c','c b a')
   sage: r = p.rauzy_diagram()
   sage: g0 = r.path(p,'t','b','t')
   sage: g0.losers()
   ['a', 'c', 'b']
   sage: g1 = r.path(p,'b','t','b')
   sage: g1.losers()
   ['c', 'a', 'b']
pop()
   Pops the queue of the path
   OUTPUT:
   a path corresponding to the last edge
   EXAMPLES:
   sage: p = iet.Permutation('a b','b a')
   sage: r = p.rauzy_diagram()
   sage: q = r.path(p, 0, 1, 0)
   sage: g0,g1,g2,g3 = g[0], g[1], g[2], g[3]
   sage: g.pop() == r.path(g2,0)
   True
   sage: g == r.path(g0,0,1)
```

```
sage: g.pop() == r.path(g1,1)
   True
   sage: g == r.path(g0,0)
   sage: g.pop() == r.path(g0,0)
   True
   sage: g == r.path(g0)
   True
   sage: g.pop() == r.path(g0)
   True
right_composition (function, composition=None)
   Compose an edges function on a path
   INPUT:
      •function - function must be of the form (indice,type) -> element.
      tion(None, None) must be an identity element for initialization.
      •composition - the composition function for the function. * if None (defaut None)
   sage: p = iet.Permutation('a b','b a')
   sage: r = p.rauzy_diagram()
   sage: def f(i,t):
   . . . . :
             if t is None: return []
             return [t]
   . . . . :
   sage: g = r.path(p)
   sage: g.right_composition(f,list.__add__)
   sage: g = r.path(p, 0, 1)
   sage: g.right_composition(f, list.__add__)
   [1, 0]
```

### start()

Returns the first vertex of the path.

### **EXAMPLES**:

```
sage: p = iet.Permutation('a b c','c b a')
sage: r = p.rauzy_diagram()
sage: g = r.path(p, 't', 'b')
sage: q.start() == p
True
```

#### winners()

Returns the winner list associated to the edge of the path.

# **EXAMPLES:**

```
sage: p = iet.Permutation('a b','b a')
sage: r = p.rauzy_diagram()
sage: r.path(p).winners()
[]
sage: r.path(p,0).winners()
sage: r.path(p,1).winners()
['a']
```

RauzyDiagram.alphabet (data=None)

TESTS:

Moreover func-

```
sage: r = iet.RauzyDiagram('a b','b a')
sage: r.alphabet() == Alphabet(['a','b'])
True
sage: r = iet.RauzyDiagram([0,1],[1,0])
sage: r.alphabet() == Alphabet([0,1])
True
```

# RauzyDiagram.cardinality()

Returns the number of permutations in this Rauzy diagram.

#### **OUTPUT:**

•integer - the number of vertices in the diagram

#### EXAMPLES:

```
sage: r = iet.RauzyDiagram('a b','b a')
sage: r.cardinality()
1
sage: r = iet.RauzyDiagram('a b c','c b a')
sage: r.cardinality()
3
sage: r = iet.RauzyDiagram('a b c d','d c b a')
sage: r.cardinality()
7
```

# RauzyDiagram.complete(p)

Completion of the Rauzy diagram.

Add to the Rauzy diagram all permutations that are obtained by successive operations defined by edge\_types(). The permutation must be of the same type and the same length as the one used for the creation.

#### INPUT:

•p - a permutation of Interval exchange transformation

Rauzy diagram is the reunion of all permutations that could be obtained with successive rauzy moves. This function just use the functions \_\_getitem\_\_ and has\_rauzy\_move and rauzy\_move which must be defined for child and their corresponding permutation types.

# TEST:

```
sage: r = iet.RauzyDiagram('a b c','c b a') #indirect doctest
sage: r = iet.RauzyDiagram('a b c','c b a',left_induction=True) #indirect doctest
sage: r = iet.RauzyDiagram('a b c','c b a',symmetric=True) #indirect doctest
sage: r = iet.RauzyDiagram('a b c','c b a',lr_inversion=True) #indirect doctest
sage: r = iet.RauzyDiagram('a b c','c b a',tb_inversion=True) #indirect doctest
```

#### RauzyDiagram.edge\_iterator()

Returns an iterator over the edges of the graph.

```
sage: p = iet.Permutation('a b','b a')
sage: r = p.rauzy_diagram()
sage: for e in r.edge_iterator():
....: print e[0].str(sep='/'), '-->', e[1].str(sep='/')
a b/b a --> a b/b a
a b/b a --> a b/b a
```

```
RauzvDiagram.edge_to_loser(p=None, edge_type=None)
    Return the corresponding loser
    sage: r = iet.RauzyDiagram('a b','b a')
    sage: r.edge_to_loser(None, None)
    []
RauzyDiagram.edge_to_matrix(p=None, edge_type=None)
    Return the corresponding matrix
    INPUT:
       •p - a permutation
       •edge_type - 0 or 1 corresponding to the type of the edge
    OUTPUT:
    A matrix
    EXAMPLES:
    sage: p = iet.Permutation('a b c','c b a')
    sage: d = p.rauzy_diagram()
    sage: print d.edge_to_matrix(p,1)
    [1 0 1]
    [0 1 0]
    [0 0 1]
RauzyDiagram.edge_to_winner(p=None, edge_type=None)
    Return the corresponding winner
    TEST:
    sage: r = iet.RauzyDiagram('a b','b a')
    sage: r.edge_to_winner(None, None)
    []
RauzyDiagram.edge_types()
    Print information about edges.
    EXAMPLES:
    sage: r = iet.RauzyDiagram('a b', 'b a')
    sage: r.edge_types()
    0: rauzy_move(0, -1)
    1: rauzy_move(1, -1)
    sage: r = iet.RauzyDiagram('a b', 'b a', left_induction=True)
    sage: r.edge_types()
    0: rauzy_move(0, -1)
    1: rauzy_move(1, -1)
    2: rauzy_move(0, 0)
    3: rauzy_move(1, 0)
    sage: r = iet.RauzyDiagram('a b',' b a', symmetric=True)
    sage: r.edge_types()
    0: rauzy_move(0, -1)
    1: rauzy_move(1, -1)
    2: symmetric()
```

```
RauzyDiagram.edge_types_index(data)
    Try to convert the data as an edge type.
    INPUT:
       •data - a string
    OUTPUT:
    integer
    EXAMPLES:
    For a standard Rauzy diagram (only right induction) the 0 index corresponds to the 'top' induction and the
    index 1 corresponds to the 'bottom' one:
    sage: p = iet.Permutation('a b c','c b a')
    sage: r = p.rauzy_diagram()
    sage: r.edge_types_index('top')
    sage: r[p][0] == p.rauzy_move('top')
    True
    sage: r.edge_types_index('bottom')
    sage: r[p][1] == p.rauzy_move('bottom')
    True
    The special operations (inversion and symmetry) always appears after the different Rauzy inductions:
    sage: p = iet.Permutation('a b c','c b a')
    sage: r = p.rauzy_diagram(symmetric=True)
    sage: r.edge_types_index('symmetric')
    sage: r[p][2] == p.symmetric()
    True
    This function always try to resolve conflictuous name. If it's impossible a ValueError is raised:
    sage: p = iet.Permutation('a b c','c b a')
    sage: r = p.rauzy_diagram(left_induction=True)
    sage: r.edge_types_index('top')
    Traceback (most recent call last):
    ValueError: left and right inductions must be differentiated
    sage: r.edge_types_index('top_right')
    sage: r[p][0] == p.rauzy_move(0)
    True
    sage: r.edge_types_index('bottom_left')
    sage: r[p][3] == p.rauzy_move('bottom', 'left')
    True
    sage: p = iet.Permutation('a b c','c b a')
    sage: r = p.rauzy_diagram(left_right_inversion=True,top_bottom_inversion=True)
    sage: r.edge_types_index('inversion')
    Traceback (most recent call last):
    ValueError: left-right and top-bottom inversions must be differentiated
    sage: r.edge_types_index('lr_inverse')
```

sage: p.lr\_inverse() == r[p][2]

```
True
    sage: r.edge_types_index('tb_inverse')
    sage: p.tb_inverse() == r[p][3]
    True
    Short names are accepted:
    sage: p = iet.Permutation('a b c','c b a')
    sage: r = p.rauzy_diagram(right_induction='top',top_bottom_inversion=True)
    sage: r.edge_types_index('top_rauzy_move')
    sage: r.edge_types_index('t')
    sage: r.edge_types_index('tb')
    sage: r.edge_types_index('inversion')
    sage: r.edge_types_index('inverse')
    sage: r.edge_types_index('i')
RauzyDiagram.edges(labels=True)
    Returns a list of the edges.
    EXAMPLES:
    sage: r = iet.RauzyDiagram('a b','b a')
    sage: len(r.edges())
RauzyDiagram.graph()
    Returns the Rauzy diagram as a Graph object
    The graph returned is more precisely a DiGraph (directed graph) with loops and multiedges allowed.
    EXAMPLES:
    sage: r = iet.RauzyDiagram('a b c','c b a')
    sage: r
    Rauzy diagram with 3 permutations
    sage: r.graph()
    Looped multi-digraph on 3 vertices
RauzyDiagram.letters()
    Returns the letters used by the RauzyDiagram.
    EXAMPLES:
    sage: r = iet.RauzyDiagram('a b','b a')
    sage: r.alphabet()
    {'a', 'b'}
    sage: r.letters()
    ['a', 'b']
    sage: r.alphabet('ABCDEF')
    sage: r.alphabet()
    {'A', 'B', 'C', 'D', 'E', 'F'}
    sage: r.letters()
    ['A', 'B']
```

```
RauzyDiagram.path(*data)
         Returns a path over this Rauzy diagram.
         INPUT:
            •initial_vertex - the initial vertex (starting point of the path)
            •data - a sequence of edges
         EXAMPLES:
         sage: p = iet.Permutation('a b c','c b a')
         sage: r = p.rauzy_diagram()
         sage: g = r.path(p, 'top', 'bottom')
    RauzyDiagram.vertex_iterator()
         Returns an iterator over the vertices
         EXAMPLES:
         sage: r = iet.RauzyDiagram('a b','b a')
         sage: for p in r.vertex_iterator(): print p
         a b
         b a
         sage: r = iet.RauzyDiagram('a b c d','d c b a')
         sage: from itertools import ifilter
         sage: r_1n = ifilter(lambda x: x.is_cylindric(), r)
         sage: for p in r_1n: print p
         abcd
         d c b a
    RauzyDiagram.vertices()
         Returns a list of the vertices.
         EXAMPLES:
         sage: r = iet.RauzyDiagram('a b','b a')
         sage: for p in r.vertices(): print p
         a b
         b a
sage.dynamics.interval_exchanges.template.interval_conversion(interval=None)
    Converts the argument in 0 or 1.
    INPUT:
        •winner - 'top' (or 't' or 0) or bottom (or 'b' or 1)
    OUTPUT:
    integer -0 or 1
    TESTS:
    sage: from sage.dynamics.interval_exchanges.template import interval_conversion
    sage: interval_conversion('top')
    sage: interval_conversion('t')
    sage: interval_conversion(0)
    sage: interval_conversion('bottom')
```

```
sage: interval_conversion('b')
     sage: interval_conversion(1)
sage.dynamics.interval_exchanges.template.labelize_flip(couple)
     Returns a string from a 2-uple couple of the form (name, flip).
     sage: from sage.dynamics.interval exchanges.template import labelize flip
     sage: labelize_flip((0,1))
     sage: labelize_flip((0,-1))
     '-0'
sage.dynamics.interval exchanges.template.side conversion(side=None)
     Converts the argument in 0 or -1.
     INPUT:
        •side - either 'left' (or 'l' or 0) or 'right' (or 'r' or -1)
     OUTPUT:
     integer -0 or -1
     TESTS:
     sage: from sage.dynamics.interval exchanges.template import side_conversion
     sage: side_conversion('left')
     sage: side_conversion('l')
     sage: side_conversion(0)
     sage: side_conversion('right')
     -1
     sage: side_conversion('r')
    -1
     sage: side_conversion(1)
     sage: side_conversion(-1)
     -1
sage.dynamics.interval_exchanges.template.twin_list_iet (a=None)
     Returns the twin list of intervals.
     The twin intervals is the correspondance between positions of labels in such way that a[interval][position] is
     a[1-interval][twin[interval][position]]
     INPUT:
        •a - two lists of labels
     OUTPUT:
     list – a list of two lists of integers
     TESTS:
     sage: from sage.dynamics.interval_exchanges.template import twin_list_iet
     sage: twin_list_iet([['a','b','c'],['a','b','c']])
```

```
[[0, 1, 2], [0, 1, 2]]
    sage: twin_list_iet([['a','b','c'],['a','c','b']])
    [[0, 2, 1], [0, 2, 1]]
    sage: twin_list_iet([['a','b','c'],['b','a','c']])
     [[1, 0, 2], [1, 0, 2]]
    sage: twin_list_iet([['a','b','c'],['b','c','a']])
     [[2, 0, 1], [1, 2, 0]]
    sage: twin_list_iet([['a','b','c'],['c','a','b']])
    [[1, 2, 0], [2, 0, 1]]
    sage: twin_list_iet([['a','b','c'],['c','b','a']])
    [[2, 1, 0], [2, 1, 0]]
sage.dynamics.interval_exchanges.template.twin_list_li(a=None)
    Returns the twin list of intervals
    INPUT:
        •a - two lists of labels
    OUTPUT:
    list – a list of two lists of couples of integers
    TESTS:
    sage: from sage.dynamics.interval_exchanges.template import twin_list_li
    sage: twin_list_li([['a','a','b','b'],[]])
    [[(0, 1), (0, 0), (0, 3), (0, 2)], []]
    sage: twin_list_li([['a','a','b'],['b']])
    [[(0, 1), (0, 0), (1, 0)], [(0, 2)]]
    sage: twin_list_li([['a','a'],['b','b']])
     [[(0, 1), (0, 0)], [(1, 1), (1, 0)]]
    sage: twin_list_li([['a'], ['a','b','b']])
     [[(1, 0)], [(0, 0), (1, 2), (1, 1)]]
    sage: twin_list_li([[], ['a','a','b','b']])
     [[], [(1, 1), (1, 0), (1, 3), (1, 2)]]
```

# 1.5 Interval Exchange Transformations and Linear Involution

An interval exchage transformation is a map defined on an interval (see help(iet.IntervalExchangeTransformation) for a more complete help.

#### **EXAMPLES:**

Initialization of a simple iet with integer lengths:

```
sage: T = iet.IntervalExchangeTransformation(Permutation([3,2,1]), [3,1,2])
sage: print T
Interval exchange transformation of [0, 6[ with permutation
1 2 3
3 2 1
```

Rotation corresponds to iet with two intervals:

```
sage: p = iet.Permutation('a b', 'b a')
sage: T = iet.IntervalExchangeTransformation(p, [1, (sqrt(5)-1)/2])
sage: print T.in_which_interval(0)
```

```
sage: print T.in_which_interval(T(0))
sage: print T.in_which_interval(T(T(0)))
sage: print T.in_which_interval(T(T(T(0))))
There are two plotting methods for iet:
sage: p = iet.Permutation('a b c','c b a')
sage: T = iet.IntervalExchangeTransformation(p, [1, 2, 3])
class sage.dynamics.interval_exchanges.iet.IntervalExchangeTransformation(permutation=None,
                                                                                      lengths=None)
     Bases: sage.structure.sage_object.SageObject
     Interval exchange transformation
     INPUT:
        •permutation - a permutation (LabelledPermutationIET)
        •lengths - the list of lengths
     EXAMPLES:
     Direct initialization:
     sage: p = iet.IET(('a b c','c b a'), {'a':1,'b':1,'c':1})
     sage: p.permutation()
     a b c
     c b a
     sage: p.lengths()
     [1, 1, 1]
     Initialization from a iet.Permutation:
     sage: perm = iet.Permutation('a b c','c b a')
     sage: 1 = [0.5, 1, 1.2]
     sage: t = iet.IET(perm, 1)
     sage: t.permutation() == perm
     sage: t.lengths() == 1
     True
     Initialization from a Permutation:
     sage: p = Permutation([3,2,1])
     sage: iet.IET(p, [1,1,1])
     Interval exchange transformation of [0, 3[ with permutation
     1 2 3
     3 2 1
     If it is not possible to convert lengths to real values an error is raised:
     sage: iet.IntervalExchangeTransformation(('a b','b a'),['e','f'])
     Traceback (most recent call last):
     TypeError: unable to convert x (='e') into a real number
```

The value for the lengths must be positive:

```
sage: iet.IET(('a b','b a'),[-1,-1])
Traceback (most recent call last):
ValueError: lengths must be positive
domain_singularities()
    Returns the list of singularities of T
    OUTPUT:
    list - positive reals that corresponds to singularities in the top interval
    EXAMPLES:
    sage: t = iet.IET(("a b", "b a"), [1, sqrt(2)])
    sage: t.domain_singularities()
    [0, 1, sqrt(2) + 1]
in which interval (x, interval=0)
    Returns the letter for which x is in this interval.
    INPUT:
       •x - a positive number
       •interval - (default: 'top') 'top' or 'bottom'
    OUTPUT:
    label – a label corresponding to an interval
    TEST:
    sage: t = iet.IntervalExchangeTransformation(('a b c','c b a'),[1,1,1])
    sage: t.in_which_interval(0)
    'a'
    sage: t.in_which_interval(0.3)
    'a'
    sage: t.in_which_interval(1)
    'b'
    sage: t.in_which_interval(1.9)
    'b'
    sage: t.in_which_interval(2)
    'c'
    sage: t.in_which_interval(2.1)
    ' c'
    sage: t.in_which_interval(3)
    Traceback (most recent call last):
    ValueError: your value does not lie in [0;1[
    TESTS:
    sage: t.in_which_interval(-2.9,'bottom')
    Traceback (most recent call last):
    ValueError: your value does not lie in [0;1[
inverse()
    Returns the inverse iet.
    OUTPUT:
```

iet – the inverse interval exchange transformation

```
EXAMPLES:
```

```
sage: p = iet.Permutation("a b","b a")
sage: s = iet.IET(p, [1,sqrt(2)-1])
sage: t = s.inverse()
sage: t.permutation()
b a
a b
sage: t.lengths()
[1, sqrt(2) - 1]
sage: t*s
Interval exchange transformation of [0, sqrt(2)[ with permutation aa bb aa bb
```

We can verify with the method .is\_identity():

```
sage: p = iet.Permutation("a b c d","d a c b")
sage: s = iet.IET(p, [1, sqrt(2), sqrt(3), sqrt(5)])
sage: (s * s.inverse()).is_identity()
True
sage: (s.inverse() * s).is_identity()
```

## is\_identity()

Returns True if self is the identity.

**OUTPUT**:

boolean - the answer

## **EXAMPLES:**

```
sage: p = iet.Permutation("a b","b a")
sage: q = iet.Permutation("c d","d c")
sage: s = iet.IET(p, [1,5])
sage: t = iet.IET(q, [5,1])
sage: (s*t).is_identity()
True
sage: (t*s).is_identity()
```

## ${\bf length}\,(\,)$

Returns the total length of the interval.

**OUTPUT**:

real - the length of the interval

## **EXAMPLES:**

```
sage: t = iet.IntervalExchangeTransformation(('a b','b a'),[1,1])
sage: t.length()
2
```

## lengths()

Returns the list of lengths associated to this iet.

**OUTPUT**:

list – the list of lengths of subinterval

```
EXAMPLES:
    sage: p = iet.IntervalExchangeTransformation(('a b','b a'),[1,3])
    sage: p.lengths()
    [1, 3]
normalize(total=1)
    Returns a interval exchange transformation of normalized lengths.
    The normalization consists in multiplying all lengths by a constant in such way that their sum is given by
    total (default is 1).
    INPUT:
       •total - (default: 1) The total length of the interval
    OUTPUT:
    iet - the normalized iet
    EXAMPLES:
    sage: t = iet.IntervalExchangeTransformation(('a b','b a'), [1,3])
    sage: t.length()
    sage: s = t.normalize(2)
    sage: s.length()
    sage: s.lengths()
    [1/2, 3/2]
    TESTS:
    sage: s = t.normalize('bla')
    Traceback (most recent call last):
    TypeError: unable to convert total (='bla') into a real number
    sage: s = t.normalize(-691)
    Traceback (most recent call last):
    ValueError: the total length must be positive
permutation()
    Returns the permutation associated to this iet.
    OUTPUT:
    permutation - the permutation associated to this iet
    EXAMPLES:
    sage: perm = iet.Permutation('a b c','c b a')
    sage: p = iet.IntervalExchangeTransformation(perm, (1,2,1))
    sage: p.permutation() == perm
    True
plot (position=(0, 0), vertical_alignment='center', horizontal_alignment='left', interval_height=0.1,
      labels height=0.05, fontsize=14, labels=True, colors=None)
    Returns a picture of the interval exchange transformation.
    INPUT:
       •position - a 2-uple of the position
```

```
•horizontal_alignment - left (defaut), center or right
        •labels - boolean (defaut: True)
        •fontsize - the size of the label
    OUTPUT:
    2d plot – a plot of the two intervals (domain and range)
    EXAMPLES:
    sage: t = iet.IntervalExchangeTransformation(('a b','b a'),[1,1])
    sage: t.plot_two_intervals()
    Graphics object consisting of 8 graphics primitives
plot_function(**d)
    Return a plot of the interval exchange transformation as a function.
    INPUT:
        •Any option that is accepted by line2d
    OUTPUT:
    2d plot – a plot of the iet as a function
    EXAMPLES:
    sage: t = iet.IntervalExchangeTransformation(('a b c d','d a c b'),[1,1,1,1])
    sage: t.plot_function(rgbcolor=(0,1,0))
    Graphics object consisting of 4 graphics primitives
plot_two_intervals (position=(0, 0), vertical_alignment='center', horizontal_alignment='left',
                        interval_height=0.1, labels_height=0.05, fontsize=14, labels=True, col-
    Returns a picture of the interval exchange transformation.
    INPUT:
        •position - a 2-uple of the position
        •horizontal_alignment - left (defaut), center or right
        •labels - boolean (defaut: True)
        •fontsize - the size of the label
    OUTPUT:
    2d plot – a plot of the two intervals (domain and range)
    EXAMPLES:
    sage: t = iet.IntervalExchangeTransformation(('a b','b a'),[1,1])
    sage: t.plot_two_intervals()
    Graphics object consisting of 8 graphics primitives
range_singularities()
    Returns the list of singularities of T^{-1}
    OUTPUT:
    list – real numbers that are singular for T^{-1}
    EXAMPLES:
```

```
sage: t = iet.IET(("a b", "b a"), [1, sqrt(2)])
    sage: t.range_singularities()
    [0, sqrt(2), sqrt(2) + 1]
rauzy_move (side='right', iterations=1)
    Performs a Rauzy move.
    INPUT:
       •side - 'left' (or 'l' or 0) or 'right' (or 'r' or 1)
       •iterations - integer (default :1) the number of iteration of Rauzy moves to perform
    OUTPUT:
    iet – the Rauzy move of self
    EXAMPLES:
    sage: phi = QQbar((sqrt(5)-1)/2)
    sage: t1 = iet.IntervalExchangeTransformation(('a b','b a'),[1,phi])
    sage: t2 = t1.rauzy_move().normalize(t1.length())
    sage: 12 = t2.lengths()
    sage: 11 = t1.lengths()
    sage: 12[0] == 11[1] and 12[1] == 11[0]
    True
show()
    Shows a picture of the interval exchange transformation
    EXAMPLES:
    sage: phi = QQbar((sqrt(5)-1)/2)
    sage: t = iet.IntervalExchangeTransformation(('a b','b a'),[1,phi])
    sage: t.show()
singularities()
    The list of singularities of T and T^{-1}.
    OUTPUT:
    list – two lists of positive numbers which corresponds to extremities of subintervals
    EXAMPLE:
    sage: t = iet.IntervalExchangeTransformation(('a b','b a'),[1/2,3/2])
    sage: t.singularities()
    [[0, 1/2, 2], [0, 3/2, 2]]
```

**CHAPTER** 

**TWO** 

## ABELIAN DIFFERENTIALS AND FLAT SURFACES

## 2.1 Strata of differentials on Riemann surfaces

The space of Abelian (or quadratic) differentials is stratified by the degrees of the zeroes (and simple poles for quadratic differentials). Each stratum has one, two or three connected components and each is associated to an (extended) Rauzy class. The connected\_components() method (only available for Abelian stratum) give the decomposition of a stratum (which corresponds to the SAGE object AbelianStratum).

The work for Abelian differentials was done by Maxim Kontsevich and Anton Zorich in [KonZor03] and for quadratic differentials by Erwan Lanneau in [Lan08]. Zorich gave an algorithm to pass from a connected component of a stratum to the associated Rauzy class (for both interval exchange transformations and linear involutions) in [Zor08] and is implemented for Abelian stratum at different level (approximately one for each component):

- for connected stratum representative ()
- for hyperellitic component representative ()
- · for non hyperelliptic component, the algorithm is the same as for connected component
- for odd component representative ()
- for even component representative ()

The inverse operation (pass from an interval exchange transformation to the connected component) is partially written in [KonZor03] and simply named here connected\_component().

All the code here was first available on Mathematica [ZS].

## **REFERENCES:**

**Note:** The quadratic strata are not yet implemented.

## **AUTHORS:**

• Vincent Delecroix (2009-09-29): initial version

#### **EXAMPLES:**

Construction of a stratum from a list of singularity degrees:

```
sage: a = AbelianStratum(1,1)
sage: print a
H(1, 1)
sage: print a.genus()
2
sage: print a.nintervals()
5
```

```
sage: a = AbelianStratum(4,3,2,1)
sage: print a
H(4, 3, 2, 1)
sage: print a.genus()
6
sage: print a.nintervals()
15
```

By convention, the degrees are always written in decreasing order:

```
sage: a1 = AbelianStratum(4,3,2,1)
sage: a1
H(4, 3, 2, 1)
sage: a2 = AbelianStratum(2,3,1,4)
sage: a2
H(4, 3, 2, 1)
sage: a1 == a2
True
```

It is also possible to consider stratum with an incoming or an outgoing separatrix marked (the aim of this consideration is to attach a specified degree at the left or the right of the associated interval exchange transformation):

```
sage: a_out = AbelianStratum(1, 1, marked_separatrix='out')
sage: a_out
H^out(1, 1)
sage: a_in = AbelianStratum(1, 1, marked_separatrix='in')
sage: a_in
H^in(1, 1)
sage: a_out == a_in
False
```

Get a list of strata with constraints on genus or on the number of intervals of a representative:

```
sage: for a in AbelianStrata(genus=3):
         print a
. . . . :
H(4)
H(3, 1)
H(2, 2)
H(2, 1, 1)
H(1, 1, 1, 1)
sage: for a in AbelianStrata(nintervals=5):
....: print a
H^{\text{out}}(0, 2)
H^{out}(2, 0)
H^out (1, 1)
H^out(0, 0, 0, 0)
sage: for a in AbelianStrata(genus=2, nintervals=5):
....: print a
H^out(0, 2)
H^out(2, 0)
H^out (1, 1)
```

Obtains the connected components of a stratum:

```
sage: a = AbelianStratum(0)
sage: print a.connected_components()
[H_hyp(0)]
sage: a = AbelianStratum(6)
sage: cc = a.connected_components()
sage: print cc
[H_hyp(6), H_odd(6), H_even(6)]
sage: for c in cc:
          print c, "\n", c.representative(alphabet=range(1,9))
. . . . :
H_hyp(6)
1 2 3 4 5 6 7 8
8 7 6 5 4 3 2 1
H_odd(6)
1 2 3 4 5 6 7 8
4 3 6 5 8 7 2 1
H_even(6)
1 2 3 4 5 6 7 8
6 5 4 3 8 7 2 1
sage: a = AbelianStratum(1, 1, 1, 1)
sage: print a.connected_components()
[H_c(1, 1, 1, 1)]
sage: c = a.connected_components()[0]
sage: print c.representative(alphabet="abcdefghi")
abcdefqhi
edcfihqba
The zero attached on the left of the associated Abelian permutation corresponds to the first singularity degree:
sage: a = AbelianStratum(4, 2, marked_separatrix='out')
sage: b = AbelianStratum(2, 4, marked_separatrix='out')
sage: print a == b
False
sage: print a, ":", a.connected_components()
H^{out}(4, 2) : [H_{odd}^{out}(4, 2), H_{even}^{out}(4, 2)]
sage: print b, ":", b.connected_components()
H^out(2, 4) : [H_odd^out(2, 4), H_even^out(2, 4)]
sage: a_odd, a_even = a.connected_components()
sage: b_odd, b_even = b.connected_components()
The representatives are hence different:
sage: print a_odd.representative(alphabet=range(1,10))
1 2 3 4 5 6 7 8 9
4 3 6 5 7 9 8 2 1
sage: print b_odd.representative(alphabet=range(1,10))
1 2 3 4 5 6 7 8 9
4 3 5 7 6 9 8 2 1
sage: print a_even.representative(alphabet=range(1,10))
1 2 3 4 5 6 7 8 9
```

sage: print b\_even.representative(alphabet=range(1,10))

6 5 4 3 7 9 8 2 1

1 2 3 4 5 6 7 8 9 7 6 5 4 3 9 8 2 1 You can retrieve the decomposition of the irreducible Abelian permutations into Rauzy diagrams from the classification of strata:

```
sage: a = AbelianStrata(nintervals=4)
sage: 1 = sum([stratum.connected_components() for stratum in a], [])
sage: n = map(lambda x: x.rauzy_diagram().cardinality(), l)
sage: for c,i in zip(l,n):
. . . . :
         print c, ":", i
H_hyp^out(2): 7
H_hyp^out(0, 0, 0) : 6
sage: print sum(n)
13
sage: a = AbelianStrata(nintervals=5)
sage: 1 = sum([stratum.connected_components() for stratum in a], [])
sage: n = map(lambda x: x.rauzy_diagram().cardinality(), 1)
sage: for c,i in zip(l,n):
....: print c, ":", i
H \text{ hyp}^{\circ}\text{out}(0, 2) : 11
H_hyp^out(2, 0) : 35
H_hyp^out(1, 1) : 15
H_hyp^out(0, 0, 0, 0) : 10
sage: print sum(n)
71
sage: a = AbelianStrata(nintervals=6)
sage: 1 = sum([stratum.connected_components() for stratum in a], [])
sage: n = map(lambda x: x.rauzy_diagram().cardinality(), 1)
sage: for c,i in zip(l,n):
         print c, ":", i
. . . . :
H_hyp^out(4): 31
H_odd^out(4): 134
H_hyp^out(0, 2, 0) : 66
H_hyp^out(2, 0, 0) : 105
H_hyp^out(0, 1, 1) : 20
H_hyp^out(1, 1, 0) : 90
H_hyp^out(0, 0, 0, 0, 0) : 15
sage: print sum(n)
461
sage.dynamics.flat_surfaces.strata.AbelianStrata(genus=None,
                                                                          nintervals=None,
                                                          marked_separatrix=None)
    Abelian strata.
    INPUT:
        •genus - a non negative integer or None
        •nintervals - a non negative integer or None
        •marked_separatrix - 'no' (for no marking), 'in' (for marking an incoming separatrix) or 'out' (for
         marking an outgoing separatrix)
    EXAMPLES:
    Abelian strata with a given genus:
    sage: for s in AbelianStrata(genus=1): print s
    H(0)
```

```
sage: for s in AbelianStrata(genus=2): print s
H(2)
H(1, 1)
sage: for s in AbelianStrata(genus=3): print s
H(3, 1)
H(2, 2)
H(2, 1, 1)
H(1, 1, 1, 1)
sage: for s in AbelianStrata(genus=4): print s
H(6)
H(5, 1)
H(4, 2)
H(4, 1, 1)
H(3, 3)
H(3, 2, 1)
H(3, 1, 1, 1)
H(2, 2, 2)
H(2, 2, 1, 1)
H(2, 1, 1, 1, 1)
H(1, 1, 1, 1, 1, 1)
Abelian strata with a given number of intervals:
sage: for s in AbelianStrata(nintervals=2): print s
H^out (0)
sage: for s in AbelianStrata(nintervals=3): print s
H^{\text{out}}(0, 0)
sage: for s in AbelianStrata(nintervals=4): print s
H^out (2)
H^out(0, 0, 0)
sage: for s in AbelianStrata(nintervals=5): print s
H^{out}(0, 2)
H^out(2, 0)
H^out(1, 1)
H^{out}(0, 0, 0, 0)
Abelian strata with both constraints:
sage: for s in AbelianStrata(genus=2, nintervals=4): print s
H^out (2)
sage: for s in AbelianStrata(genus=5, nintervals=12): print s
H^out(8, 0, 0)
H^out(0, 8, 0)
H^{out}(0, 7, 1)
H^{out}(1, 7, 0)
H^{out}(7, 1, 0)

class sage.dynamics.flat_surfaces.strata.AbelianStrata_all(category=None)
     Bases: sage.combinat.combinat.InfiniteAbstractCombinatorialClass
     Abelian strata.
class sage.dynamics.flat surfaces.strata.AbelianStrata d(nintervals=None,
                                                                  marked_separatrix=None)
     Bases: sage.combinat.combinat.CombinatorialClass
     Strata with constraint number of intervals.
     INPUT:
        •nintervals - an integer greater than 1
        •marked separatrix - 'no', 'out' or 'in'
class sage.dynamics.flat_surfaces.strata.AbelianStrata_g (genus=None,
                                                                  marked_separatrix=None)
     Bases: sage.combinat.combinat.CombinatorialClass
     Stratas of genus g surfaces.
     INPUT:
        •genus - a non negative integer
        •marked_separatrix - 'no', 'out' or 'in'
class sage.dynamics.flat_surfaces.strata.AbelianStrata_gd (genus=None,
                                                                                      nin-
                                                                   tervals=None,
                                                                   marked separatrix=None)
     Bases: sage.combinat.combinat.CombinatorialClass
     Abelian strata of prescribed genus and number of intervals.
     INPUT:
        •genus - integer: the genus of the surfaces
        •nintervals - integer: the number of intervals
        •marked_separatrix - 'no', 'in' or 'out'
class sage.dynamics.flat_surfaces.strata.AbelianStratum(*l, **d)
     Bases: sage.structure.sage_object.SageObject
     Stratum of Abelian differentials.
```

A stratum with a marked outgoing separatrix corresponds to Rauzy diagram with left induction, a stratum with marked incoming separatrix correspond to Rauzy diagram with right induction. If there is no marked separatrix, the associated Rauzy diagram is the extended Rauzy diagram (consideration of the sage.dynamics.interval\_exchanges.template.Permutation.symmetric() operation of Boissy-Lanneau).

When you want to specify a marked separatrix, the degree on which it is is the first term of your degrees list.

#### INPUT:

•marked\_separatrix - None (default) or 'in' (for incoming separatrix) or 'out' (for outgoing separatrix).

## **EXAMPLES:**

Creation of an Abelian stratum and get its connected components:

```
sage: a = AbelianStratum(2, 2)
sage: print a
H(2, 2)
sage: a.connected_components()
[H_hyp(2, 2), H_odd(2, 2)]
```

#### Specification of marked separatrix:

```
sage: a = AbelianStratum(4,2,marked_separatrix='in')
sage: print a
H^{in}(4, 2)
sage: b = AbelianStratum(2,4,marked_separatrix='in')
sage: print b
H^{in}(2, 4)
sage: a == b
False
sage: a = AbelianStratum(4,2,marked_separatrix='out')
sage: print a
H^{\text{out}}(4, 2)
sage: b = AbelianStratum(2,4,marked_separatrix='out')
sage: print b
H^out(2, 4)
sage: a == b
False
```

## Get a representative of a connected component:

```
sage: a = AbelianStratum(2,2)
sage: a_hyp, a_odd = a.connected_components()
sage: print a_hyp.representative()
1 2 3 4 5 6 7
7 6 5 4 3 2 1
sage: print a_odd.representative()
0 1 2 3 4 5 6
3 2 4 6 5 1 0
```

#### You can choose the alphabet:

```
sage: print a_odd.representative(alphabet="ABCDEFGHIJKLMNOPQRSTUVWXYZ")
A B C D E F G
D C E G F B A
```

By default, you get a reduced permutation, but you can specify that you want a labelled one:

```
sage: p_reduced = a_odd.representative()
sage: p_labelled = a_odd.representative(reduced=False)
connected_components()
    Lists the connected components of the Stratum.
    OUTPUT:
    list – a list of connected components of stratum
    EXAMPLES:
    sage: AbelianStratum(0).connected_components()
    [H_hyp(0)]
    sage: AbelianStratum(2).connected_components()
    [H_hyp(2)]
    sage: AbelianStratum(1,1).connected_components()
    [H_hyp(1, 1)]
    sage: AbelianStratum(4).connected_components()
    [H_hyp(4), H_odd(4)]
    sage: AbelianStratum(3,1).connected_components()
    [H_c(3, 1)]
    sage: AbelianStratum(2,2).connected_components()
    [H_hyp(2, 2), H_odd(2, 2)]
    sage: AbelianStratum(2,1,1).connected_components()
    [H_c(2, 1, 1)]
    sage: AbelianStratum(1,1,1,1).connected_components()
    [H_c(1, 1, 1, 1)]
genus()
    Returns the genus of the stratum.
    OUTPUT:
    integer - the genus
    EXAMPLES:
    sage: AbelianStratum(0).genus()
    sage: AbelianStratum(1,1).genus()
    sage: AbelianStratum(3,2,1).genus()
is_connected()
    Tests if the strata is connected.
    OUTPUT:
    boolean - True if it is connected else False
    EXAMPLES:
    sage: AbelianStratum(2).is_connected()
    sage: AbelianStratum(2).connected_components()
    [H_hyp(2)]
```

```
sage: AbelianStratum(2,2).is_connected()
False
sage: AbelianStratum(2,2).connected_components()
[H_hyp(2, 2), H_odd(2, 2)]

nintervals()
Returns the number of intervals of any iet of the strata.
OUTPUT:
integer - the number of intervals for any associated iet
EXAMPLES:
sage: AbelianStratum(0).nintervals()
2
sage: AbelianStratum(0,0).nintervals()
3
sage: AbelianStratum(2).nintervals()
4
sage: AbelianStratum(1,1).nintervals()
```

sage.dynamics.flat\_surfaces.strata.CCA
alias of ConnectedComponentOfAbelianStratum

class sage.dynamics.flat\_surfaces.strata.ConnectedComponentOfAbelianStratum(parent)
 Bases: sage.structure.sage\_object.SageObject

Connected component of Abelian stratum.

Warning: Internal class! Do not use directly!

## TESTS:

Tests for outgoing marked separatrices:

```
sage: a = AbelianStratum(4,2,0,marked_separatrix='out')
sage: a_odd, a_even = a.connected_components()
sage: a_odd.representative().attached_out_degree()
4
sage: a_even.representative().attached_out_degree()
4
sage: a = AbelianStratum(2,4,0,marked_separatrix='out')
sage: a_odd, a_even = a.connected_components()
sage: a_odd.representative().attached_out_degree()
2
sage: a_even.representative().attached_out_degree()
2
sage: a = AbelianStratum(0,4,2,marked_separatrix='out')
sage: a_odd, a_even = a.connected_components()
sage: a_odd.representative().attached_out_degree()
0
sage: a_even.representative().attached_out_degree()
0
sage: a_even.representative().attached_out_degree()
0
sage: a_even.representative().attached_out_degree()
0
```

```
sage: a_c.representative().attached_out_degree()
sage: a = AbelianStratum(2,3,1,marked_separatrix='out')
sage: a_c = a.connected_components()[0]
sage: a_c.representative().attached_out_degree()
sage: a = AbelianStratum(1,3,2,marked_separatrix='out')
sage: a_c = a.connected_components()[0]
sage: a_c.representative().attached_out_degree()
Tests for incoming separatrices:
sage: a = AbelianStratum(4,2,0,marked_separatrix='in')
sage: a_odd, a_even = a.connected_components()
sage: a_odd.representative().attached_in_degree()
sage: a_even.representative().attached_in_degree()
sage: a = AbelianStratum(2,4,0,marked_separatrix='in')
sage: a_odd, a_even = a.connected_components()
sage: a_odd.representative().attached_in_degree()
sage: a_even.representative().attached_in_degree()
sage: a = AbelianStratum(0,4,2,marked_separatrix='in')
sage: a_odd, a_even = a.connected_components()
sage: a_odd.representative().attached_in_degree()
sage: a_even.representative().attached_in_degree()
sage: a = AbelianStratum(3,2,1,marked_separatrix='in')
sage: a_c = a.connected_components()[0]
sage: a_c.representative().attached_in_degree()
3
sage: a = AbelianStratum(2,3,1,marked_separatrix='in')
sage: a_c = a.connected_components()[0]
sage: a_c.representative().attached_in_degree()
sage: a = AbelianStratum(1,3,2,marked_separatrix='in')
sage: a_c = a.connected_components()[0]
sage: a_c.representative().attached_in_degree()
genus()
    Returns the genus of the surfaces in this connected component.
    OUTPUT:
    integer - the genus of the surface
    EXAMPLES:
```

```
sage: a = AbelianStratum(6,4,2,0,0)
    sage: c_odd, c_even = a.connected_components()
    sage: c_odd.genus()
    sage: c_even.genus()
    sage: a = AbelianStratum([1] *8)
    sage: c = a.connected_components()[0]
    sage: c.genus()
nintervals()
    Returns the number of intervals of the representative.
    integer – the number of intervals in any representative
    EXAMPLES:
    sage: a = AbelianStratum(6, 4, 2, 0, 0)
    sage: c_odd, c_even = a.connected_components()
    sage: c_odd.nintervals()
    sage: c_even.nintervals()
    sage: a = AbelianStratum([1] *8)
    sage: c = a.connected_components()[0]
    sage: c.nintervals()
    17
parent()
    The stratum of this component
    OUTPUT:
    stratum - the stratum where this component leaves
    EXAMPLES:
    sage: p = iet.Permutation('a b','b a')
    sage: c = p.connected_component()
    sage: c.parent()
    H(0)
rauzy diagram (reduced=True)
    Returns the Rauzy diagram associated to this connected component.
    OUTPUT:
    rauzy diagram - the Rauzy diagram associated to this stratum
```

#### **EXAMPLES:**

```
sage: c = AbelianStratum(0).connected_components()[0]
sage: r = c.rauzy_diagram()
```

## representative (reduced=True, alphabet=None)

Returns the Zorich representative of this connected component.

Zorich constructs explicitely interval exchange transformations for each stratum in [Zor08].

## INPUT:

- •reduced boolean (default: True): whether you obtain a reduced or labelled permutation
- •alphabet an alphabet or None: whether you want to specify an alphabet for your permutation

## **OUTPUT:**

permutation – a permutation which lives in this component

#### **EXAMPLES:**

```
sage: c = AbelianStratum(1,1,1,1).connected_components()[0]
sage: print c
H_c(1, 1, 1, 1)
sage: p = c.representative(alphabet=range(9))
sage: print p
0 1 2 3 4 5 6 7 8
4 3 2 5 8 7 6 1 0
sage: p.connected_component()
H_c(1, 1, 1, 1)
```

sage.dynamics.flat\_surfaces.strata.EvenCCA

alias of EvenConnectedComponentOfAbelianStratum

class sage.dynamics.flat\_surfaces.strata.EvenConnectedComponentOfAbelianStratum(parent)

Bases: sage.dynamics.flat\_surfaces.strata.ConnectedComponentOfAbelianStratum

Connected component of Abelian stratum with even spin structure.

Warning: Internal class! Do not use directly!

## representative (reduced=True, alphabet=None)

Returns the Zorich representative of this connected component.

Zorich constructs explicitely interval exchange transformations for each stratum in [Zor08].

## **EXAMPLES:**

```
sage: c = AbelianStratum(6).connected_components()[2]
sage: c
H_even(6)
sage: p = c.representative(alphabet=range(8))
sage: p
0 1 2 3 4 5 6 7
5 4 3 2 7 6 1 0
sage: p.connected_component()
H_even(6)
sage: c = AbelianStratum(4,4).connected_components()[2]
sage: c
H \text{ even}(4, 4)
sage: p = c.representative(alphabet=range(11))
sage: p
0 1 2 3 4 5 6 7 8 9 10
5 4 3 2 6 8 7 10 9 1 0
sage: p.connected_component()
H_{\text{even}}(4, 4)
```

sage.dynamics.flat\_surfaces.strata.HypCCA

alias of HypConnectedComponentOfAbelianStratum

Hyperelliptic component of Abelian stratum.

```
Warning: Internal class! Do not use directly!
```

## representative (reduced=True, alphabet=None)

Returns the Zorich representative of this connected component.

Zorich constructs explicitely interval exchange transformations for each stratum in [Zor08].

## INPUT:

- •reduced boolean (defaut: True): whether you obtain a reduced or labelled permutation
- •alphabet alphabet or None (defaut: None): whether you want to specify an alphabet for your representative

## **EXAMPLES:**

```
sage: c = AbelianStratum(0).connected_components()[0]
sage: c
H_hyp(0)
sage: p = c.representative(alphabet="01")
sage: p
0 1
1 0
sage: p.connected_component()
H_hyp(0)
sage: c = AbelianStratum(0,0).connected_components()[0]
sage: c
H \text{ hyp}(0, 0)
sage: p = c.representative(alphabet="abc")
sage: p
a b c
c b a
sage: p.connected_component()
H_hyp(0, 0)
sage: c = AbelianStratum(2).connected_components()[0]
sage: c
H_hyp(2)
sage: p = c.representative(alphabet="ABCD")
sage: p
ABCD
D C B A
sage: p.connected_component()
H_hyp(2)
sage: c = AbelianStratum(1,1).connected_components()[0]
sage: c
H_hyp(1, 1)
sage: p = c.representative(alphabet="01234")
sage: p
0 1 2 3 4
4 3 2 1 0
sage: p.connected_component()
H_hyp(1, 1)
```

```
sage.dynamics.flat_surfaces.strata.NonHypCCA
alias of NonHypConnectedComponentOfAbelianStratum
```

 ${\bf class} \; {\tt sage.dynamics.flat\_surfaces.strata.NonHypConnectedComponentOfAbelianStratum} \; (\textit{parent}) \\$ 

 $Bases: \verb|sage.dynamics.flat_surfaces.strata.ConnectedComponentOfAbelianStratum| \\$ 

Non hyperelliptic component of Abelian stratum.

```
Warning: Internal class! Do not use directly!
```

```
sage.dynamics.flat_surfaces.strata.OddCCA
    alias of OddConnectedComponentOfAbelianStratum
```

 ${\bf class} \; {\tt sage.dynamics.flat\_surfaces.strata.OddConnectedComponentOfAbelianStratum} \; (\textit{parent}) \\$ 

Bases: sage.dynamics.flat\_surfaces.strata.ConnectedComponentOfAbelianStratum

Connected component of an Abelian stratum with odd spin parity.

```
Warning: Internal class! Do not use directly!
```

```
representative (reduced=True, alphabet=None)
```

Returns the Zorich representative of this connected component.

Zorich constructs explicitely interval exchange transformations for each stratum in [Zor08].

#### **EXAMPLES:**

```
sage: a = AbelianStratum(6).connected_components()[1]
sage: print a.representative(alphabet=range(8))
0 1 2 3 4 5 6 7
3 2 5 4 7 6 1 0

sage: a = AbelianStratum(4,4).connected_components()[1]
sage: print a.representative(alphabet=range(11))
0 1 2 3 4 5 6 7 8 9 10
3 2 5 4 6 8 7 10 9 1 0
```

# 2.2 Strata of quadratic differentials on Riemann surfaces

```
\begin{tabular}{ll} \textbf{class} & \texttt{sage.dynamics.flat\_surfaces.quadratic\_strata.QuadraticStratum} (*l) \\ \textbf{Bases: sage.structure.sage\_object.SageObject} \end{tabular}
```

Stratum of quadratic differentials.

```
genus()
```

Returns the genus.

#### **EXAMPLES**:

```
sage: QuadraticStratum(-1,-1,-1,-1).genus()
0
```

**CHAPTER** 

## THREE

## **SANDPILES**

Functions and classes for mathematical sandpiles.

Version: 2.4

#### AUTHOR:

• David Perkinson (June 4, 2015) Upgraded from version 2.3 to 2.4.

#### **MAJOR CHANGES**

- 1. Eliminated dependence on 4ti2, substituting the use of Polyhedron methods. Thus, no optional packages are necessary.
- 2. Fixed bug in Sandpile. \_\_init\_\_ so that now multigraphs are handled correctly.
- 3. Created sandpiles to handle examples of Sandpiles in analogy with graphs, simplicial\_complexes, and polytopes. In the process, we implemented a much faster way of producing the sandpile grid graph.
- 4. Added support for open and closed sandpile Markov chains.
- 5. Added support for Weierstrass points.
- 6. Implemented the Cori-Le Borgne algorithm for computing ranks of divisors on complete graphs.

## **NEW METHODS**

**Sandpile**: avalanche\_polynomial, genus, group\_gens, help, jacobian\_representatives, markov\_chain, picard\_representatives, smith\_form, stable\_configs, stationary\_density, tutte\_polynomial.

SandpileConfig: burst size, help.

**SandpileDivisor**: help, is\_linearly\_equivalent, is\_q\_reduced, is\_weierstrass\_pt, polytope, polytope\_integer\_pts, q\_reduced, rank, simulate\_threshold, stabilize, weierstrass\_div, weierstrass\_gap\_seq, weierstrass\_pts, weierstrass\_rank\_seq.

## **DEPRECATED**

SandpileDivisor.linear\_system, SandpileDivisor.r\_of\_D, sandlib method, complete\_sandpile, grid\_sandpile, triangle\_sandpile, aztec\_sandpile, random\_digraph, random\_tree, glue\_graphs, admissible\_partitions, firing\_vector, min\_cycles.

## MINOR CHANGES

- The sink argument to Sandpile.\_\_init\_\_ now defaults to the first vertex.
- A SandpileConfig or SandpileDivisor may now be multiplied by an integer.
- $\bullet \ \ Sped\ up\ \underline{\hspace{0.3cm}} add\underline{\hspace{0.3cm}} method\ for\ SandpileConfig\ and\ SandpileDivisor.$
- Enhanced string representation of a Sandpile (via \_repr\_ and the name methods).
- Recurrents for complete graphs and cycle graphs are computed more quickly.

- The stabilization code for SandpileConfig has been made more efficient.
- Added optional probability distribution arguments to add\_random methods.
- Marshall Hampton (2010-1-10) modified for inclusion as a module within Sage library.
- David Perkinson (2010-12-14) added show3d(), fixed bug in resolution(), replaced elementary\_divisors() with invariant\_factors(), added show() for SandpileConfig and SandpileDivisor.
- David Perkinson (2010-9-18): removed is\_undirected, added show(), added verbose arguments to several functions to display SandpileConfigs and divisors as lists of integers
- David Perkinson (2010-12-19): created separate SandpileConfig, SandpileDivisor, and Sandpile classes
- David Perkinson (2009-07-15): switched to using config\_to\_list instead of .values(), thus fixing a few bugs when not using integer labels for vertices.
- David Perkinson (2009): many undocumented improvements
- David Perkinson (2008-12-27): initial version

## **EXAMPLES:**

For general help, enter Sandpile.help(), SandpileConfig.help(), and SandpileDivisor.help(). Miscellaneous examples appear below.

A weighted directed graph given as a Python dictionary:

The associated sandpile with 0 chosen as the sink:

```
sage: S = Sandpile(g,0)
Or just:
sage: S = Sandpile(g)
```

A picture of the graph:

```
sage: S.show()
```

The relevant Laplacian matrices:

```
sage: S.laplacian()
[ 0  0  0  0  0]
[-1  3 -1 -1  0]
[ 0 -1  3 -1 -1]
[ 0  -1 -1  3 -1]
[ 0  0 -1 -1  2]
sage: S.reduced_laplacian()
[ 3  -1  -1  0]
[-1  3  -1 -1]
[ -1  -1  3 -1]
[ 0  -1  -1  2]
```

The number of elements of the sandpile group for S:

2: {1:

```
sage: S.group_order()
```

The structure of the sandpile group:

```
sage: S.invariant_factors()
[1, 1, 1, 8]
```

The elements of the sandpile group for S:

```
sage: S.recurrents()
[{1: 2, 2: 2, 3: 2, 4: 1},
{1: 2, 2: 2, 3: 2, 4: 0},
{1: 2, 2: 1, 3: 2, 4: 0},
{1: 2, 2: 2, 3: 0, 4: 1},
{1: 2, 2: 0, 3: 2, 4: 1},
{1: 2, 2: 2, 3: 1, 4: 0},
{1: 2, 2: 1, 3: 2, 4: 1},
{1: 2, 2: 2, 3: 1, 4: 0},
```

The maximal stable element (2 grains of sand on vertices 1, 2, and 3, and 1 grain of sand on vertex 4:

```
sage: S.max_stable()
{1: 2, 2: 2, 3: 2, 4: 1}
sage: S.max_stable().values()
[2, 2, 2, 1]
```

The identity of the sandpile group for S:

```
sage: S.identity()
{1: 2, 2: 2, 3: 2, 4: 0}
```

An arbitrary sandpile configuration:

```
sage: c = SandpileConfig(S,[1,0,4,-3])
sage: c.equivalent_recurrent()
{1: 2, 2: 2, 3: 2, 4: 0}
```

Some group operations:

```
sage: m = S.max_stable()
sage: i = S.identity()
sage: m.values()
[2, 2, 2, 1]
sage: i.values()
[2, 2, 2, 0]
sage: m + i
               # coordinate-wise sum
{1: 4, 2: 4, 3: 4, 4: 1}
sage: m - i
{1: 0, 2: 0, 3: 0, 4: 1}
sage: m & i # add, then stabilize
{1: 2, 2: 2, 3: 2, 4: 1}
sage: e = m + m
sage: e
{1: 4, 2: 4, 3: 4, 4: 2}
sage: ~e # stabilize
{1: 2, 2: 2, 3: 2, 4: 0}
sage: a = -m
```

```
sage: a & m
{1: 0, 2: 0, 3: 0, 4: 0}
sage: a * m # add, then find the equivalent recurrent
{1: 2, 2: 2, 3: 2, 4: 0}
sage: a^3 # a*a*a
{1: 2, 2: 2, 3: 2, 4: 1}
sage: a^(-1) == m
sage: a < m # every coordinate of a is < that of m</pre>
Firing an unstable vertex returns resulting configuration:
sage: c = S.max_stable() + S.identity()
sage: c.fire_vertex(1)
{1: 1, 2: 5, 3: 5, 4: 1}
sage: c
{1: 4, 2: 4, 3: 4, 4: 1}
Fire all unstable vertices:
sage: c.unstable()
[1, 2, 3]
sage: c.fire_unstable()
{1: 3, 2: 3, 3: 3, 4: 3}
Stabilize c, returning the resulting configuration and the firing vector:
sage: c.stabilize(True)
[{1: 2, 2: 2, 3: 2, 4: 1}, {1: 6, 2: 8, 3: 8, 4: 8}]
sage: c
{1: 4, 2: 4, 3: 4, 4: 1}
sage: S.max_stable() & S.identity() == c.stabilize()
True
The number of superstable configurations of each degree:

1

2

Some various ways of creating Sandpiles:

```
sage: S = sandpiles.Complete(4) # for more options enter ''sandpile.TAB''
sage: S = sandpiles.Wheel(6)
```

A multidigraph with loops (vertices 0, 1, 2; for example, there is a directed edge from vertex 2 to vertex 1 of weight 3, which can be thought of as three directed edges of the form (2,3). There is also a single loop at vertex 2 and an edge (2,0) of weight 2):

```
sage: S = Sandpile(\{0:[1,2], 1:[0,0,2], 2:[0,0,1,1,1,2], 3:[2]\})
```

Using the graph library (vertex 1 is specified as the sink; omitting this would make the sink vertex 0 by default):

```
sage: S = Sandpile(graphs.PetersenGraph(),1)
```

Distribution of avalanche sizes:

Working with sandpile divisors:

```
sage: S = sandpiles.Complete(4)
sage: D = SandpileDivisor(S, [0,0,0,5])
sage: E = D.stabilize(); E
\{0: 1, 1: 1, 2: 1, 3: 2\}
sage: D.is_linearly_equivalent(E)
True
sage: D.q_reduced()
\{0: 4, 1: 0, 2: 0, 3: 1\}
sage: S = sandpiles.Complete(4)
sage: D = SandpileDivisor(S, [0,0,0,5])
sage: E = D.stabilize(); E
\{0: 1, 1: 1, 2: 1, 3: 2\}
sage: D.is_linearly_equivalent(E)
sage: D.g_reduced()

sage: D.weierstrass_pts()
(0, 1, 2, 3)
sage: D.weierstrass_rank_seq(0)
(2, 1, 0, 0, 0, -1)
class sage.sandpiles.sandpile (g, sink=None)
     Bases: sage.graphs.digraph.DiGraph
     Class for Dhar's abelian sandpile model.
     all_k_config(k)
         The constant configuration with all values set to k.
         INPUT:
         k - integer
         OUTPUT:
         SandpileConfig
         EXAMPLES:
         sage: s = sandpiles.Diamond()
         sage: s.all_k_config(7)
         {1: 7, 2: 7, 3: 7}
     all k \operatorname{div}(k)
         The divisor with all values set to k.
         INPUT:
         k - integer
         OUTPUT:
         SandpileDivisor
         EXAMPLES:
```

```
sage: S = sandpiles.House()
sage: S.all_k_div(7)
{0: 7, 1: 7, 2: 7, 3: 7, 4: 7}
```

## avalanche\_polynomial (multivariable=True)

The avalanche polynomial. See NOTE for details.

#### INPUT:

```
multivariable - (default: True) boolean
```

## **OUTPUT**:

#### polynomial

#### **EXAMPLES:**

```
sage: s = sandpiles.Complete(4)
sage: s.avalanche_polynomial()
9*x0*x1*x2 + 2*x0*x1 + 2*x0*x2 + 2*x1*x2 + 3*x0 + 3*x1 + 3*x2 + 24
sage: s.avalanche_polynomial(False)
9*x0^3 + 6*x0^2 + 9*x0 + 24
```

**Note:** For each nonsink vertex v, let  $x_v$  be an indeterminate. If (r,v) is a pair consisting of a recurrent r and nonsink vertex v, then for each nonsink vertex w, let  $n_w$  be the number of times vertex w fires in the stabilization of r+v. Let M(r,v) be the monomial  $\prod_w x_w^{n_w}$ , i.e., the exponent records the vector of  $n_w$  as w ranges over the nonsink vertices. The avalanche polynomial is then the sum of M(r,v) as r ranges over the recurrents and v ranges over the nonsink vertices. If multivariable is False, then set all the indeterminates equal to each other (and, thus, only count the number of vertex firings in the stabilizations, forgetting which particular vertices fired).

## betti (verbose=True)

The Betti table for the homogeneous toppling ideal. If verbose is True, it prints the standard Betti table, otherwise, it returns a less formated table.

#### INPUT:

```
verbose - (default: True) boolean
```

## **OUTPUT**:

Betti numbers for the sandpile

## **EXAMPLES:**

```
sage: S = sandpiles.Diamond()
sage: S.betti()
          0
                 1
                       2
   0:
          1
                 2
   1:
    2:
                 4
                       9
total:
         1
                 6
sage: S.betti(False)
[1, 6, 9, 4]
```

## betti complexes()

The support-complexes with non-trivial homology. (See NOTE.)

**OUTPUT**:

list (of pairs [divisors, corresponding simplicial complex])

#### **EXAMPLES:**

```
sage: S = Sandpile(\{0:\{\}, 1:\{0: 1, 2: 1, 3: 4\}, 2:\{3: 5\}, 3:\{1: 1, 2: 1\}\}, 0)
sage: p = S.betti_complexes()
sage: p[0]
[{0: -8, 1: 5, 2: 4, 3: 1}, Simplicial complex with vertex set (1, 2, 3) and facets {(1, 2),
sage: S.resolution()
'R^1 <-- R^5 <-- R^1'
sage: S.betti()
                1
                     2
          0
   0:
         1
   1:
                5
total: 1
              5 5
sage: len(p)
sage: p[0][1].homology()
{0: Z, 1: 0}
sage: p[-1][1].homology()
{0: 0, 1: 0, 2: Z}
```

**Note:** A support-complex is the simplicial complex formed from the supports of the divisors in a linear system.

## burning\_config()

The minimal burning configuration.

## **OUTPUT**:

dict (configuration)

## **EXAMPLES:**

**Note:** The burning configuration and script are computed using a modified version of Speer's script algorithm. This is a generalization to directed multigraphs of Dhar's burning algorithm.

A burning configuration is a nonnegative integer-linear combination of the rows of the reduced Laplacian matrix having nonnegative entries and such that every vertex has a path from some vertex in its support. The corresponding burning script gives the integer-linear combination needed to obtain the burning configuration. So if b is the burning configuration,  $\sigma$  is its script, and  $\tilde{L}$  is the reduced Laplacian, then  $\sigma \cdot \tilde{L} = b$ .

The *minimal burning configuration* is the one with the minimal script (its components are no larger than the components of any other script for a burning configuration).

The following are equivalent for a configuration c with burning configuration b having script  $\sigma$ :

- •c is recurrent;
- •c + b stabilizes to c;
- •the firing vector for the stabilization of c + b is  $\sigma$ .

## burning\_script()

A script for the minimal burning configuration.

**OUTPUT:** 

dict

#### **EXAMPLES:**

```
sage: g = {0:{},1:{0:1,3:1,4:1},2:{0:1,3:1,5:1},\
3:{2:1,5:1},4:{1:1,3:1},5:{2:1,3:1}}
sage: S = Sandpile(g,0)
sage: S.burning_config()
{1: 2, 2: 0, 3: 1, 4: 1, 5: 0}
sage: S.burning_config().values()
[2, 0, 1, 1, 0]
sage: S.burning_script()
{1: 1, 2: 3, 3: 5, 4: 1, 5: 4}
sage: script = S.burning_script().values()
sage: script
[1, 3, 5, 1, 4]
sage: matrix(script)*S.reduced_laplacian()
[2 0 1 1 0]
```

**Note:** The burning configuration and script are computed using a modified version of Speer's script algorithm. This is a generalization to directed multigraphs of Dhar's burning algorithm.

A burning configuration is a nonnegative integer-linear combination of the rows of the reduced Laplacian matrix having nonnegative entries and such that every vertex has a path from some vertex in its support. The corresponding burning script gives the integer-linear combination needed to obtain the burning configuration. So if b is the burning configuration, s is its script, and  $L_{\rm red}$  is the reduced Laplacian, then  $s \cdot L_{\rm red} = b$ . The minimal burning configuration is the one with the minimal script (its components are no larger than the components of any other script for a burning configuration).

The following are equivalent for a configuration c with burning configuration b having script s:

- •c is recurrent;
- •c + b stabilizes to c;
- •the firing vector for the stabilization of c + b is s.

## canonical\_divisor()

The canonical divisor. This is the divisor with deg(v) - 2 grains of sand on each vertex (not counting loops). Only for undirected graphs.

**OUTPUT**:

SandpileDivisor

**EXAMPLES:** 

```
sage: S = sandpiles.Complete(4)
sage: S.canonical_divisor()
{0: 1, 1: 1, 2: 1, 3: 1}
sage: s = Sandpile({0:[1,1],1:[0,0,1,1,1]},0)
sage: s.canonical_divisor() # loops are disregarded
{0: 0, 1: 0}
```

Warning: The underlying graph must be undirected.

```
dict()
```

A dictionary of dictionaries representing a directed graph.

**OUTPUT**:

dict

#### **EXAMPLES:**

```
sage: S = sandpiles.Diamond()
sage: S.dict()
{0: {1: 1, 2: 1},
    1: {0: 1, 2: 1, 3: 1},
    2: {0: 1, 1: 1, 3: 1},
    3: {1: 1, 2: 1}}
sage: S.sink()
0
```

## genus()

The genus: (# non-loop edges) - (# vertices) + 1. Only defined for undirected graphs.

**OUTPUT**:

integer

## **EXAMPLES:**

```
sage: sandpiles.Complete(4).genus()
3
sage: sandpiles.Cycle(5).genus()
1
```

## groebner()

A Groebner basis for the homogeneous toppling ideal. It is computed with respect to the standard sandpile ordering (see ring).

OUTPUT:

Groebner basis

```
EXAMPLES:
```

```
sage: S = sandpiles.Diamond()
sage: S.groebner()
[x3*x2^2 - x1^2*x0, x2^3 - x3*x1*x0, x3*x1^2 - x2^2*x0, x1^3 - x3*x2*x0, x3^2 - x0^2, x2*x1
```

## group\_gens (verbose=True)

A minimal list of generators for the sandpile group. If verbose is False then the generators are represented as lists of integers.

INPUT:

```
verbose - (default: True) boolean
```

## **OUTPUT**:

list of SandpileConfig (or of lists of integers if verbose is False)

```
EXAMPLES:
```

```
sage: s = sandpiles.Cycle(5)
sage: s.group_gens()
[{1: 1, 2: 1, 3: 1, 4: 0}]
sage: s.group_gens()[0].order()
5
sage: s = sandpiles.Complete(5)
sage: s.group_gens(False)
[[2, 2, 3, 2], [2, 3, 2, 2], [3, 2, 2, 2]]
sage: [i.order() for i in s.group_gens()]
[5, 5, 5]
sage: s.invariant_factors()
[1, 5, 5, 5]
```

## group\_order()

The size of the sandpile group.

**OUTPUT**:

integer

#### **EXAMPLES:**

```
sage: S = sandpiles.House()
sage: S.group_order()
11
```

#### h vector()

The number of superstable configurations in each degree. Equivalently, this is the list of first differences of the Hilbert function of the (homogeneous) toppling ideal.

## **OUTPUT**:

list of nonnegative integers

#### **EXAMPLES:**

```
sage: s = sandpiles.Grid(2,2)
sage: s.hilbert_function()
[1, 5, 15, 35, 66, 106, 146, 178, 192]
sage: s.h_vector()
[1, 4, 10, 20, 31, 40, 40, 32, 14]
```

## static help (verbose=True)

List of Sandpile-specific methods (not inherited from Graph). If verbose, include short descriptions.

## INPUT:

```
verbose - (default: True) boolean
OUTPUT:
printed string
EXAMPLES:
sage: Sandpile.help()
```

enter "Sandpile.FOO?" or enter "S.FOO?" for any Sandpile S.

For detailed help with any method FOO listed below,

```

## hilbert\_function()

The Hilbert function of the homogeneous toppling ideal.

**OUTPUT**:

list of nonnegative integers

### **EXAMPLES:**

```
sage: s = sandpiles.Wheel(5)
sage: s.hilbert_function()
[1, 5, 15, 31, 45]
sage: s.h_vector()
[1, 4, 10, 16, 14]
```

# ideal(gens=False)

The saturated homogeneous toppling ideal. If gens is True, the generators for the ideal are returned instead.

### **INPUT:**

```
gens - (default: False) boolean
```

### **OUTPUT:**

ideal or, optionally, the generators of an ideal

# **EXAMPLES:**

```
sage: S = sandpiles.Diamond()
sage: S.ideal()
Ideal (x2*x1 - x0^2, x3^2 - x0^2, x1^3 - x3*x2*x0, x3*x1^2 - x2^2*x0, x2^3 - x3*x1*x0, x3*x2
sage: S.ideal(True)
[x2*x1 - x0^2, x3^2 - x0^2, x1^3 - x3*x2*x0, x3*x1^2 - x2^2*x0, x2^3 - x3*x1*x0, x3*x2^2 - x3*x2^2 - x3*x2^2 - x3^2 -
```

# identity (verbose=True)

The identity configuration. If verbose is False, the configuration are converted to a list of integers.

### INPUT:

```
verbose - (default: True) boolean
```

# OUTPUT:

SandpileConfig or a list of integers If verbose is False, the configuration are converted to a list of integers.

### **EXAMPLES:**

```
sage: s = sandpiles.Diamond()
sage: s.identity()
{1: 2, 2: 2, 3: 0}
sage: s.identity(False)
[2, 2, 0]
sage: s.identity() & s.max_stable() == s.max_stable()
True
```

# in\_degree (v=None)

The in-degree of a vertex or a list of all in-degrees.

# INPUT:

```
∨ – (optional) vertex name
```

### **OUTPUT**:

integer or dict

### **EXAMPLES:**

```
sage: s = sandpiles.House()
sage: s.in_degree()
{0: 2, 1: 2, 2: 3, 3: 3, 4: 2}
sage: s.in_degree(2)
3
```

### invariant\_factors()

The invariant factors of the sandpile group.

### **OUTPUT**:

list of integers

### **EXAMPLES:**

```
sage: s = sandpiles.Grid(2,2)
sage: s.invariant_factors()
[1, 1, 8, 24]
```

### is undirected()

Is the underlying graph undirected? True if (u, v) is and edge if and only if (v, u) is an edge, each edge with the same weight.

### **OUTPUT**:

boolean

### **EXAMPLES:**

```
sage: sandpiles.Complete(4).is_undirected()
True
sage: s = Sandpile({0:[1,2], 1:[0,2], 2:[0]}, 0)
sage: s.is_undirected()
False
```

### jacobian\_representatives (verbose=True)

Representatives for the elements of the Jacobian group. If verbose is False, then lists representing the divisors are returned.

### INPUT:

```
verbose - (default: True) boolean
```

# OUTPUT:

list of SandpileDivisor (or of lists representing divisors)

### **EXAMPLES:**

For an undirected graph, divisors of the form s - deg(s) \*sink as s varies over the superstables forms a distinct set of representatives for the Jacobian group.:

```
sage: s = sandpiles.Complete(3)
sage: s.superstables(False)
[[0, 0], [0, 1], [1, 0]]
sage: s.jacobian_representatives(False)
[[0, 0, 0], [-1, 0, 1], [-1, 1, 0]]
```

If the graph is directed, the representatives described above may by equivalent modulo the rowspan of the Laplacian matrix:

```
sage: s = Sandpile({0: {1: 1, 2: 2}, 1: {0: 2, 2: 4}, 2: {0: 4, 1: 2}},0)
sage: s.group_order()
28
sage: s.jacobian_representatives()
[{0: -5, 1: 3, 2: 2}, {0: -4, 1: 3, 2: 1}]
```

Let  $\tau$  be the nonnegative generator of the kernel of the transpose of the Laplacian, and let  $tau_s$  be it sink component, then the sandpile group is isomorphic to the direct sum of the cyclic group of order  $\tau_s$  and the Jacobian group. In the example above, we have:

```
sage: s.laplacian().left_kernel()
Free module of degree 3 and rank 1 over Integer Ring
Echelon basis matrix:
[14 5 8]
```

**Note:** The Jacobian group is the set of all divisors of degree zero modulo the integer rowspan of the Laplacian matrix.

### laplacian()

The Laplacian matrix of the graph. Its rows encode the vertex firing rules.

### **OUTPUT**:

matrix

### **EXAMPLES:**

```
sage: G = sandpiles.Diamond()
sage: G.laplacian()
[ 2 -1 -1 0]
[-1 3 -1 -1]
[-1 -1 3 -1]
[ 0 -1 -1 2]
```

**Warning:** The function laplacian\_matrix should be avoided. It returns the indegree version of the Laplacian.

#### markov chain (state, distrib=None)

The sandpile Markov chain for configurations or divisors. The chain starts at state. See NOTE for details.

# INPUT:

- •state SandpileConfig, SandpileDivisor, or list representing one of these
- $\verb|•distrib-(optional)| list of nonnegative numbers summing to 1 (representing a prob. dist.)$

### **OUTPUT:**

generator for Markov chain (see NOTE)

```
sage: s = sandpiles.Complete(4)
sage: m = s.markov_chain([0,0,0])
sage: m.next()  # random
{1: 0, 2: 0, 3: 0}
sage: m.next().values() # random
[0, 0, 0]
sage: m.next().values() # random
```

```
[0, 0, 0]
sage: m.next().values() # random
[0, 0, 0]
sage: m.next().values() # random
[0, 1, 0]
sage: m.next().values() # random
[0, 2, 0]
sage: m.next().values() # random
[0, 2, 1]
sage: m.next().values() # random
[1, 2, 1]
sage: m.next().values() # random
[2, 2, 1]
sage: m = s.markov_chain(s.zero_div(), [0.1,0.1,0.1,0.7])
sage: m.next().values() # random
[0, 0, 0, 1]
sage: m.next().values() # random
[0, 0, 1, 1]
sage: m.next().values() # random
[0, 0, 1, 2]
sage: m.next().values() # random
[1, 1, 2, 0]
sage: m.next().values() # random
[1, 1, 2, 1]
sage: m.next().values() # random
[1, 1, 2, 2]
sage: m.next().values() # random
[1, 1, 2, 3]
sage: m.next().values() # random
[1, 1, 2, 4]
sage: m.next().values() # random
[1, 1, 3, 4]
```

**Note:** The closed sandpile Markov chain has state space consisting of the configurations on a sandpile. It transitions from a state by choosing a vertex at random (according to the probability distribution distrib), dropping a grain of sand at that vertex, and stabilizing. If the chosen vertex is the sink, the chain stays at the current state.

The open sandpile Markov chain has state space consisting of the recurrent elements, i.e., the state space is the sandpile group. It transitions from the configuration c by choosing a vertex v at random according to distrib. The next state is the stabilization of c+v. If v is the sink vertex, then the stabilization of c+v is defined to be c.

Note that in either case, if distrib is specified, its length is equal to the total number of vertices (including the sink).

### REFERENCES:

#### max stable()

The maximal stable configuration.

# **OUTPUT**:

SandpileConfig (the maximal stable configuration)

```
sage: S = sandpiles.House()
sage: S.max_stable()
```

```
{1: 1, 2: 2, 3: 2, 4: 1}
```

### max\_stable\_div()

The maximal stable divisor.

#### OUTPUT:

SandpileDivisor (the maximal stable divisor)

### **EXAMPLES:**

```
sage: s = sandpiles.Diamond()
sage: s.max_stable_div()
{0: 1, 1: 2, 2: 2, 3: 1}
sage: s.out_degree()
{0: 2, 1: 3, 2: 3, 3: 2}
```

### max\_superstables (verbose=True)

The maximal superstable configurations. If the underlying graph is undirected, these are the superstables of highest degree. If verbose is False, the configurations are converted to lists of integers.

### INPUT:

```
verbose - (default: True) boolean
```

#### **OUTPUT:**

tuple of SandpileConfig

### **EXAMPLES**:

```
sage: s = sandpiles.Diamond()
sage: s.superstables(False)
[[0, 0, 0],
  [0, 0, 1],
  [1, 0, 1],
  [0, 2, 0],
  [2, 0, 0],
  [0, 1, 1],
  [1, 0, 0],
  [0, 1, 0]]
sage: s.max_superstables(False)
[[1, 0, 1], [0, 2, 0], [2, 0, 0], [0, 1, 1]]
sage: s.h_vector()
[1, 3, 4]
```

### min\_recurrents (verbose=True)

The minimal recurrent elements. If the underlying graph is undirected, these are the recurrent elements of least degree. If verbose is False, the configurations are converted to lists of integers.

### INPUT:

```
verbose - (default: True) boolean
```

## **OUTPUT**:

list of SandpileConfig

```
sage: s = sandpiles.Diamond()
sage: s.recurrents(False)
[[2, 2, 1],
```

```
[2, 2, 0],
     [1, 2, 0],
     [2, 0, 1],
     [0, 2, 1],
     [2, 1, 0],
     [1, 2, 1],
     [2, 1, 1]]
    sage: s.min_recurrents(False)
    [[1, 2, 0], [2, 0, 1], [0, 2, 1], [2, 1, 0]]
    sage: [i.deg() for i in s.recurrents()]
    [5, 4, 3, 3, 3, 4, 4]
nonsink_vertices()
    The nonsink vertices.
    OUTPUT:
    list of vertices
    EXAMPLES:
    sage: s = sandpiles.Grid(2,3)
    sage: s.nonsink_vertices()
    [(1, 1), (1, 2), (1, 3), (2, 1), (2, 2), (2, 3)]
nonspecial divisors(verbose=True)
    The nonspecial divisors. Only for undirected graphs. (See NOTE.)
    INPUT:
    verbose - (default: True) boolean
    OUTPUT:
    list (of divisors)
    EXAMPLES:
    sage: S = sandpiles.Complete(4)
    sage: ns = S.nonspecial_divisors()
    sage: D = ns[0]
    sage: D.values()
    [-1, 0, 1, 2]
    sage: D.deg()
    sage: [i.effective_div() for i in ns]
    [[], [], [], [], [], []]
```

**Note:** The "nonspecial divisors" are those divisors of degree g-1 with empty linear system. The term is only defined for undirected graphs. Here, g=|E|-|V|+1 is the genus of the graph (not counted loops as part of |E|). If <code>verbose</code> is <code>False</code>, the divisors are converted to lists of integers.

**Warning:** The underlying graph must be undirected.

```
out_degree (v=None)
```

The out-degree of a vertex or a list of all out-degrees.

INPUT:

v - (optional) vertex name

### **OUTPUT**:

integer or dict

## **EXAMPLES:**

```
sage: s = sandpiles.House()
sage: s.out_degree()
{0: 2, 1: 2, 2: 3, 3: 3, 4: 2}
sage: s.out_degree(2)
3
```

# picard\_representatives (d, verbose=True)

Representatives of the divisor classes of degree d in the Picard group. (Also see the documentation for jacobian\_representatives.)

### INPUT:

```
•d – integer
```

•verbose - (default: True) boolean

### **OUTPUT**:

list of SandpileDivisors (or lists representing divisors)

### **EXAMPLES:**

```
sage: s = sandpiles.Complete(3)
sage: s.superstables(False)
[[0, 0], [0, 1], [1, 0]]
sage: s.jacobian_representatives(False)
[[0, 0, 0], [-1, 0, 1], [-1, 1, 0]]
sage: s.picard_representatives(3,False)
[[3, 0, 0], [2, 0, 1], [2, 1, 0]]
```

## points()

Generators for the multiplicative group of zeros of the sandpile ideal.

### **OUTPUT**:

list of complex numbers

### **EXAMPLES:**

The sandpile group in this example is cyclic, and hence there is a single generator for the group of solutions.

```
sage: S = sandpiles.Complete(4)
sage: S.points()
[[1, I, -I], [I, 1, -I]]
```

### postulation()

The postulation number of the toppling ideal. This is the largest weight of a superstable configuration of the graph.

### **OUTPUT**:

nonnegative integer

```
sage: s = sandpiles.Complete(4)
sage: s.postulation()
3
```

#### recurrents (verbose=True)

The recurrent configurations. If verbose is False, the configurations are converted to lists of integers.

#### INPUT:

```
verbose - (default: True) boolean
```

### **OUTPUT**:

list of recurrent configurations

# **EXAMPLES:**

```
sage: r = Sandpile(graphs.HouseXGraph(),0).recurrents()
sage: r[:3]
[\{1:\ 2,\ 2:\ 3,\ 3:\ 3,\ 4:\ 1\},\ \{1:\ 1,\ 2:\ 3,\ 3:\ 3,\ 4:\ 0\},\ \{1:\ 1,\ 2:\ 3,\ 3:\ 3,\ 4:\ 1\}]
sage: sandpiles.Complete(4).recurrents(False)
[[2, 2, 2],
 [2, 2, 1],
 [2, 1, 2],
 [1, 2, 2],
 [2, 2, 0],
 [2, 0, 2],
 [0, 2, 2],
 [2, 1, 1],
 [1, 2, 1],
 [1, 1, 2],
 [2, 1, 0],
 [2, 0, 1],
 [1, 2, 0],
 [1, 0, 2],
 [0, 2, 1],
 [0, 1, 2]]
sage: sandpiles.Cycle(4).recurrents(False)
[[1, 1, 1], [0, 1, 1], [1, 0, 1], [1, 1, 0]]
```

### reduced\_laplacian()

The reduced Laplacian matrix of the graph.

#### **OUTPUT**:

matrix

# **EXAMPLES:**

```
sage: S = sandpiles.Diamond()
sage: S.laplacian()
[ 2 -1 -1 0]
[-1 3 -1 -1]
[-1 -1 3 -1]
[ 0 -1 -1 2]
sage: S.reduced_laplacian()
[ 3 -1 -1]
[-1 3 -1]
[-1 -1 2]
```

**Note:** This is the Laplacian matrix with the row and column indexed by the sink vertex removed.

# reorder\_vertices()

A copy of the sandpile with vertex names permuted. After reordering, vertex u comes before vertex v in the list of vertices if u is closer to the sink.

# **OUTPUT**:

### Sandpile

## **EXAMPLES:**

```
sage: S = Sandpile({0:[1], 2:[0,1], 1:[2]})
sage: S.dict()
{0: {1: 1}, 1: {2: 1}, 2: {0: 1, 1: 1}}
sage: T = S.reorder_vertices()
```

The vertices 1 and 2 have been swapped:

```
sage: T.dict()
{0: {1: 1}, 1: {0: 1, 2: 1}, 2: {0: 1}}
```

### resolution (verbose=False)

A minimal free resolution of the homogeneous toppling ideal. If verbose is True, then all of the mappings are returned. Otherwise, the resolution is summarized.

### INPUT:

```
verbose - (default: False) boolean
```

#### **OUTPUT:**

free resolution of the toppling ideal

### **EXAMPLES:**

```
sage: S = Sandpile(\{0: \{\}, 1: \{0: 1, 2: 1, 3: 4\}, 2: \{3: 5\}, 3: \{1: 1, 2: 1\}\}, 0)
sage: S.resolution() # a Gorenstein sandpile graph
'R^1 <-- R^5 <-- R^5 <-- R^1'
sage: S.resolution(True)
[x1^2 - x3*x0 x3*x1 - x2*x0 x3^2 - x2*x1 x2*x3 - x0^2 x2^2 - x1*x0],
[ x3 x2 0 x0
                  0] [ x2^2 - x1*x0]
[-x1 -x3 x2
              0 - x0]
                       [-x2*x3 + x0^2]
          0 x2
[ x0 x1
                  01 [-x3^2 + x2*x1]
      0 -x1 -x3 x2]
                        [x3*x1 - x2*x0]
     0 \times0 \times1 -\times3], [ \times1^2 -\times3*\times0]
0 ]
sage: r = S.resolution(True)
sage: r[0]*r[1]
[0 0 0 0 0]
sage: r[1] * r[2]
[0]
[0]
[0]
[0]
[0]
```

# ring()

The ring containing the homogeneous toppling ideal.

### **OUTPUT**:

ring

```
sage: S = sandpiles.Diamond()
sage: S.ring()
```

```
Multivariate Polynomial Ring in x3, x2, x1, x0 over Rational Field sage: S.ring().gens() (x3, x2, x1, x0)
```

**Note:** The indeterminate xi corresponds to the i-th vertex as listed my the method vertices. The term-ordering is degrevlex with indeterminates ordered according to their distance from the sink (larger indeterminates are further from the sink).

```
show (**kwds)
```

Draw the underlying graph.

#### INPUT:

kwds – (optional) arguments passed to the show method for Graph or DiGraph

### **EXAMPLES:**

```
sage: S = Sandpile({0:[], 1:[0,3,4], 2:[0,3,5], 3:[2,5], 4:[1,1], 5:[2,4]})
sage: S.show()
sage: S.show(graph_border=True, edge_labels=True)
```

### show3d(\*\*kwds)

Draw the underlying graph.

### INPUT:

kwds – (optional) arguments passed to the show method for Graph or DiGraph

#### **EXAMPLES:**

```
sage: S = sandpiles.House()
sage: S.show3d()
```

### sink()

The sink vertex.

### **OUTPUT**:

sink vertex

#### **EXAMPLES:**

```
sage: G = sandpiles.House()
sage: G.sink()
0
sage: H = sandpiles.Grid(2,2)
sage: H.sink()
(0, 0)
sage: type(H.sink())
<type 'tuple'>
```

# smith\_form()

The Smith normal form for the Laplacian. In detail: a list of integer matrices D, U, V such that ULV = D where L is the transpose of the Laplacian, D is diagonal, and U and V are invertible over the integers.

## OUTPUT:

list of integer matrices

```
sage: s = sandpiles.Complete(4)
sage: D,U,V = s.smith_form()
sage: D
[1 0 0 0]
[0 4 0 0]
[0 0 4 0]
[0 0 0 0]
sage: U*s.laplacian()*V == D # Laplacian symmetric => tranpose not necessary
True
```

#### solve()

Approximations of the complex affine zeros of the sandpile ideal.

### **OUTPUT:**

list of complex numbers

### **EXAMPLES:**

```
sage: S = Sandpile({0: {}, 1: {2: 2}, 2: {0: 4, 1: 1}}, 0)
sage: S.solve()
[[-0.707107 + 0.707107*I, 0.707107 - 0.707107*I], [-0.707107 - 0.707107*I, 0.707107 + 0.7071
sage: len(_)
8
sage: S.group_order()
8
```

**Note:** The solutions form a multiplicative group isomorphic to the sandpile group. Generators for this group are given exactly by points().

### stable configs(smax=None)

Generator for all stable configurations. If smax is provided, then the generator gives all stable configurations less than or equal to smax. If smax does not represent a stable configuration, then each component of smax is replaced by the corresponding component of the maximal stable configuration.

#### INPUT:

smax - (optional) SandpileConfig or list representing a SandpileConfig

# OUTPUT:

generator for all stable configurations

### **EXAMPLES:**

```
sage: s = sandpiles.Complete(3)
sage: a = s.stable_configs()
sage: a.next()
{1: 0, 2: 0}
sage: [i.values() for i in a]
[[0, 1], [1, 0], [1, 1]]
sage: b = s.stable_configs([1,0])
sage: list(b)
[{1: 0, 2: 0}, {1: 1, 2: 0}]
```

### stationary\_density()

The stationary density of the sandpile.

### **OUTPUT**:

rational number

### **EXAMPLES:**

```
sage: s = sandpiles.Complete(3)
sage: s.stationary_density()
10/9
sage: s = Sandpile(digraphs.DeBruijn(2,2),'00')
sage: s.stationary_density()
9/8
```

**Note:** The stationary density of a sandpile is the sum  $\sum_{c} (\deg(c) + \deg(s))$  where  $\deg(s)$  is the degree of the sink and the sum is over all recurrent configurations.

#### REFERENCES:

## superstables (verbose=True)

The superstable configurations. If verbose is False, the configurations are converted to lists of integers. Superstables for undirected graphs are also known as G-parking functions.

### INPUT:

```
verbose - (default: True) boolean
```

### **OUTPUT**:

list of SandpileConfig

#### **EXAMPLES:**

```
sage: sp = Sandpile(graphs.HouseXGraph(),0).superstables()
sage: sp[:3]
[\{1: 0, 2: 0, 3: 0, 4: 0\}, \{1: 1, 2: 0, 3: 0, 4: 1\}, \{1: 1, 2: 0, 3: 0, 4: 0\}]
sage: sandpiles.Complete(4).superstables(False)
[[0, 0, 0],
 [0, 0, 1],
 [0, 1, 0],
 [1, 0, 0],
 [0, 0, 2],
 [0, 2, 0],
 [2, 0, 0],
 [0, 1, 1],
 [1, 0, 1],
 [1, 1, 0],
 [0, 1, 2],
 [0, 2, 1],
 [1, 0, 2],
 [1, 2, 0],
 [2, 0, 1],
 [2, 1, 0]]
sage: sandpiles.Cycle(4).superstables(False)
[[0, 0, 0], [1, 0, 0], [0, 1, 0], [0, 0, 1]]
```

### symmetric\_recurrents (orbits)

The symmetric recurrent configurations.

# INPUT:

orbits - list of lists partitioning the vertices

### **OUTPUT**:

list of recurrent configurations

### **EXAMPLES:**

```
sage: S = Sandpile({0: {},
                    1: {0: 1, 2: 1, 3: 1},
. . . . :
                    2: {1: 1, 3: 1, 4: 1},
                    3: {1: 1, 2: 1, 4: 1},
. . . . :
                    4: {2: 1, 3: 1}})
. . . . :
sage: S.symmetric_recurrents([[1],[2,3],[4]])
[\{1: 2, 2: 2, 3: 2, 4: 1\}, \{1: 2, 2: 2, 3: 2, 4: 0\}]
sage: S.recurrents()
[\{1: 2, 2: 2, 3: 2, 4: 1\},
\{1: 2, 2: 2, 3: 2, 4: 0\},\
{1: 2, 2: 1, 3: 2, 4: 0},
{1: 2, 2: 2, 3: 0, 4: 1},
{1: 2, 2: 0, 3: 2, 4: 1},
 \{1: 2, 2: 2, 3: 1, 4: 0\},\
 \{1: 2, 2: 1, 3: 2, 4: 1\},\
 {1: 2, 2: 2, 3: 1, 4: 1}]
```

**Note:** The user is responsible for ensuring that the list of orbits comes from a group of symmetries of the underlying graph.

#### tutte polynomial()

The Tutte polynomial. Only defined for undirected sandpile graphs.

**OUTPUT:** 

polynomial

```
EXAMPLES:
```

```
sage: s = sandpiles.Complete(4)
sage: s.tutte_polynomial()
x^3 + y^3 + 3*x^2 + 4*x*y + 3*y^2 + 2*x + 2*y
sage: s.tutte_polynomial().subs(x=1)
y^3 + 3*y^2 + 6*y + 6
sage: s.tutte_polynomial().subs(x=1).coefficients() == s.h_vector()
True
```

#### unsaturated\_ideal()

The unsaturated, homogeneous toppling ideal.

**OUTPUT**:

ideal

```
EXAMPLES:
```

```
sage: S = sandpiles.Diamond()
sage: S.unsaturated_ideal().gens()
[x1^3 - x3*x2*x0, x2^3 - x3*x1*x0, x3^2 - x2*x1]
sage: S.ideal().gens()
[x2*x1 - x0^2, x3^2 - x0^2, x1^3 - x3*x2*x0, x3*x1^2 - x2^2*x0, x2^3 - x3*x1*x0, x3*x2^2 - x2^2*x0, x2^3 - x3^2*x1^2 - x2^2*x1^2 - x
```

# static version()

The version number of Sage Sandpiles.

**OUTPUT:** 

string

```
sage: Sandpile.version()
         Sage Sandpiles Version 2.4
         sage: S = sandpiles.Complete(3)
         sage: S.version()
         Sage Sandpiles Version 2.4
     zero_config()
         The all-zero configuration.
         OUTPUT:
         SandpileConfig
         EXAMPLES:
         sage: s = sandpiles.Diamond()
         sage: s.zero_config()
         {1: 0, 2: 0, 3: 0}
     zero div()
         The all-zero divisor.
         OUTPUT:
         SandpileDivisor
         EXAMPLES:
         sage: S = sandpiles.House()
         sage: S.zero_div()
         \{0: 0, 1: 0, 2: 0, 3: 0, 4: 0\}
class sage.sandpiles.sandpile.SandpileConfig (S, c)
     Bases: dict
     Class for configurations on a sandpile.
     add_random(distrib=None)
         Add one grain of sand to a random vertex. Optionally, a probability distribution, distrib, may be placed
         on the vertices or the nonsink vertices. See NOTE for details.
         INPUT:
         distrib – (optional) list of nonnegative numbers summing to 1 (representing a prob. dist.)
         OUTPUT:
         SandpileConfig
         EXAMPLES:
         sage: s = sandpiles.Complete(4)
         sage: c = s.zero_config()
         sage: c.add_random() # random
         {1: 0, 2: 1, 3: 0}
         sage: c
         {1: 0, 2: 0, 3: 0}
         sage: c.add_random([0.1,0.1,0.8]) # random
         {1: 0, 2: 0, 3: 1}
         sage: c.add_random([0.7,0.1,0.1,0.1]) # random
         {1: 0, 2: 0, 3: 0}
```

We compute the "sizes" of the avalanches caused by adding random grains of sand to the maximal stable configuration on a grid graph. The function stabilize() returns the firing vector of the stabilization, a dictionary whose values say how many times each vertex fires in the stabilization.:

**Note:** If distrib is None, then the probability is the uniform probability on the nonsink vertices. Otherwise, there are two possibilities:

- (i) the length of distrib is equal to the number of vertices, and distrib represents a probability distribution on all of the vertices. In that case, the sink may be chosen at random, in which case, the configuration is unchanged.
- (ii) Otherwise, the length of distrib must be equal to the number of nonsink vertices, and distrib represents a probability distribution on the nonsink vertices.

**Warning:** If distrib != None, the user is responsible for assuring the sum of its entries is 1 and that its length is equal to the number of sink vertices or the number of nonsink vertices.

# $burst\_size(v)$

The burst size of the configuration with respect to the given vertex.

INPUT:

v – vertex

**OUTPUT**:

integer

### **EXAMPLES:**

```
sage: s = sandpiles.Diamond()
sage: [i.burst_size(0) for i in s.recurrents()]
[1, 1, 1, 1, 1, 1, 1]
sage: [i.burst_size(1) for i in s.recurrents()]
[0, 0, 1, 2, 1, 2, 0, 2]
```

**Note:** To define c.burst (v), if v is not the sink, let c' be the unique recurrent for which the the stabilization of c' + v is c. The burst size is then the amount of sand that goes into the sink during this stabilization. If v is the sink, the burst size is defined to be 1.

REFERENCES:

### deg()

The degree of the configuration.

**OUTPUT**:

### integer

### **EXAMPLES:**

```
sage: S = sandpiles.Complete(3)
sage: c = SandpileConfig(S, [1,2])
sage: c.deg()
3
```

#### dualize()

The difference with the maximal stable configuration.

### **OUTPUT**:

### SandpileConfig

### **EXAMPLES:**

```
sage: S = sandpiles.Cycle(3)
sage: c = SandpileConfig(S, [1,2])
sage: S.max_stable()
{1: 1, 2: 1}
sage: c.dualize()
{1: 0, 2: -1}
sage: S.max_stable() - c == c.dualize()
True
```

# equivalent\_recurrent (with\_firing\_vector=False)

The recurrent configuration equivalent to the given configuration. Optionally, return the corresponding firing vector.

### INPUT:

```
with_firing_vector - (default: False) boolean
```

### **OUTPUT**:

SandpileConfig or [SandpileConfig, firing\_vector]

#### **EXAMPLES:**

```
sage: S = sandpiles.Diamond()
sage: c = SandpileConfig(S, [0,0,0])
sage: c.equivalent_recurrent() == S.identity()
True
sage: x = c.equivalent_recurrent(True)
sage: r = vector([x[0][v] for v in S.nonsink_vertices()])
sage: f = vector([x[1][v] for v in S.nonsink_vertices()])
sage: cv = vector(c.values())
sage: r == cv - f*S.reduced_laplacian()
```

**Note:** Let L be the reduced Laplacian, c the initial configuration, r the returned configuration, and f the firing vector. Then  $r = c - f \cdot L$ .

#### equivalent\_superstable (with\_firing\_vector=False)

The equivalent superstable configuration. Optionally, return the corresponding firing vector.

### **INPUT:**

```
with_firing_vector - (default: False) boolean
```

# OUTPUT:

SandpileConfig or [SandpileConfig, firing\_vector]

```
EXAMPLES:
```

```
sage: S = sandpiles.Diamond()
sage: m = S.max_stable()
sage: m.equivalent_superstable().is_superstable()
True
sage: x = m.equivalent_superstable(True)
sage: s = vector(x[0].values())
sage: f = vector(x[1].values())
sage: mv = vector(m.values())
sage: s == mv - f*S.reduced_laplacian()
True
```

**Note:** Let L be the reduced Laplacian, c the initial configuration, s the returned configuration, and f the firing vector. Then  $s = c - f \cdot L$ .

### fire\_script (sigma)

Fire the given script. In other words, fire each vertex the number of times indicated by sigma.

### INPUT:

sigma - SandpileConfig or (list or dict representing a SandpileConfig)

### **OUTPUT**:

SandpileConfig

```
EXAMPLES:
```

```
sage: S = sandpiles.Cycle(4)
sage: c = SandpileConfig(S, [1,2,3])
sage: c.unstable()
[2, 3]
sage: c.fire_script(SandpileConfig(S,[0,1,1]))
{1: 2, 2: 1, 3: 2}
sage: c.fire_script(SandpileConfig(S,[2,0,0])) == c.fire_vertex(1).fire_vertex(1)
True
```

# ${\tt fire\_unstable}\,(\,)$

Fire all unstable vertices.

### **OUTPUT**:

SandpileConfig

# **EXAMPLES:**

```
sage: S = sandpiles.Cycle(4)
sage: c = SandpileConfig(S, [1,2,3])
sage: c.fire_unstable()
{1: 2, 2: 1, 3: 2}
```

### fire\_vertex(v)

Fire the given vertex.

# INPUT:

v – vertex

**OUTPUT**:

```
SandpileConfig
    EXAMPLES:
    sage: S = sandpiles.Cycle(3)
    sage: c = SandpileConfig(S, [1,2])
    sage: c.fire_vertex(2)
    {1: 2, 2: 0}
static help (verbose=True)
    List of SandpileConfig methods. If verbose, include short descriptions.
    INPUT:
    verbose - (default: True) boolean
    OUTPUT:
    printed string
    EXAMPLES:
    sage: SandpileConfig.help()
    Shortcuts for SandpileConfig operations:
    ~c -- stabilize
    c & d -- add and stabilize
    c * c -- add and find equivalent recurrent
    c^k -- add k times and find equivalent recurrent
             (taking inverse if k is negative)
    For detailed help with any method FOO listed below,
    enter "SandpileConfig.FOO?" or enter "c.FOO?" for any SandpileConfig c.
    add_random
                          -- Add one grain of sand to a random vertex.

                          -- The unstable vertices.
    values
                          -- The values of the configuration as a list.
is recurrent()
    Is the configuration recurrent?
    OUTPUT:
    boolean
```

```
sage: S = sandpiles.Diamond()
    sage: S.identity().is_recurrent()
    sage: S.zero_config().is_recurrent()
    False
is stable()
    Is the configuration stable?
    OUTPUT:
    boolean
    EXAMPLES:
    sage: S = sandpiles.Diamond()
    sage: S.max_stable().is_stable()
    sage: (2*S.max_stable()).is_stable()
    False
    sage: (S.max_stable() & S.max_stable()).is_stable()
    True
is_superstable()
    Is the configuration superstable?
    OUTPUT:
    boolean
    EXAMPLES:
    sage: S = sandpiles.Diamond()
    sage: S.zero_config().is_superstable()
    True
is_symmetric(orbits)
    Is the configuration symmetric? Return True if the values of the configuration are constant over the
    vertices in each sublist of orbits.
    INPUT:
        orbits - list of lists of vertices
    OUTPUT:
    boolean
    EXAMPLES:
    sage: S = Sandpile({0: {}},
                         1: {0: 1, 2: 1, 3: 1},
    . . . . :
    . . . . :
                         2: {1: 1, 3: 1, 4: 1},
                         3: {1: 1, 2: 1, 4: 1},
    . . . . :
                         4: {2: 1, 3: 1}})
    . . . . :
    sage: c = SandpileConfig(S, [1, 2, 2, 3])
    sage: c.is_symmetric([[2,3]])
```

# order()

The order of the equivalent recurrent element.

OUTPUT:

True

```
integer
    EXAMPLES:
    sage: S = sandpiles.Diamond()
    sage: c = SandpileConfig(S,[2,0,1])
    sage: c.order()
    sage: \sim (c + c + c + c) == S.identity()
    sage: c = SandpileConfig(S,[1,1,0])
    sage: c.order()
    sage: c.is_recurrent()
    sage: c.equivalent_recurrent() == S.identity()
    True
sandpile()
    The configuration's underlying sandpile.
    OUTPUT:
    Sandpile
    EXAMPLES:
    sage: S = sandpiles.Diamond()
    sage: c = S.identity()
    sage: c.sandpile()
    Diamond sandpile graph: 4 \text{ vertices}, \sinh = 0
    sage: c.sandpile() == S
    True
show (sink=True, colors=True, heights=False, directed=None, **kwds)
    Show the configuration.
    INPUT:
       •sink - (default: True) whether to show the sink
       •colors – (default: True) whether to color-code the amount of sand on each vertex
       •heights - (default: False) whether to label each vertex with the amount of sand
       •directed - (optional) whether to draw directed edges
       •kwds – (optional) arguments passed to the show method for Graph
    EXAMPLES:
    sage: S = sandpiles.Diamond()
    sage: c = S.identity()
    sage: c.show()
    sage: c.show(directed=False)
    sage: c.show(sink=False,colors=False,heights=True)
stabilize(with_firing_vector=False)
    The stabilized configuration. Optionally returns the corresponding firing vector.
    INPUT:
    with_firing_vector - (default: False) boolean
    OUTPUT:
```

```
SandpileConfig or [SandpileConfig, firing_vector]
    EXAMPLES:
    sage: S = sandpiles.House()
    sage: c = 2*S.max_stable()
    sage: c._set_stabilize()
    sage: '_stabilize' in c.__dict__
    True
    sage: S = sandpiles.House()
    sage: c = S.max_stable() + S.identity()
    sage: c.stabilize(True)
    [{1: 1, 2: 2, 3: 2, 4: 1}, {1: 2, 2: 2, 3: 3, 4: 3}]
    sage: S.max_stable() & S.identity() == c.stabilize()
    sage: ~c == c.stabilize()
    True
support()
    The vertices containing sand.
    OUTPUT:
    list - support of the configuration
    EXAMPLES:
    sage: S = sandpiles.Diamond()
    sage: c = S.identity()
    sage: c
    {1: 2, 2: 2, 3: 0}
    sage: c.support()
    [1, 2]
unstable()
    The unstable vertices.
    OUTPUT:
    list of vertices
    EXAMPLES:
    sage: S = sandpiles.Cycle(4)
    sage: c = SandpileConfig(S, [1,2,3])
    sage: c.unstable()
    [2, 3]
    The values of the configuration as a list. The list is sorted in the order of the vertices.
    OUTPUT:
    list of integers
    boolean
    EXAMPLES:
    sage: S = Sandpile({'a':[1,'b'], 'b':[1,'a'], 1:['a']},'a')
    sage: c = SandpileConfig(S, {'b':1, 1:2})
    sage: c
    {1: 2, 'b': 1}
    sage: c.values()
```

```
[2, 1]
         sage: S.nonsink_vertices()
         [1, 'b']
class sage.sandpiles.sandpile.SandpileDivisor(S, D)
     Bases: dict
     Class for divisors on a sandpile.
     Dcomplex()
         The support-complex. (See NOTE.)
         OUTPUT:
         simplicial complex
         EXAMPLES:
         sage: S = sandpiles.House()
         sage: p = SandpileDivisor(S, [1,2,1,0,0]).Dcomplex()
         sage: p.homology()
         \{0: 0, 1: Z \times Z, 2: 0\}
         sage: p.f_vector()
         [1, 5, 10, 4]
         sage: p.betti()
         {0: 1, 1: 2, 2: 0}
```

**Note:** The "support-complex" is the simplicial complex determined by the supports of the linearly equivalent effective divisors.

### add random(distrib=None)

Add one grain of sand to a random vertex.

#### INPI IT:

distrib - (optional) list of nonnegative numbers representing a probability distribution on the vertices

### **OUTPUT**:

SandpileDivisor

### **EXAMPLES**:

```
sage: s = sandpiles.Complete(4)
sage: D = s.zero_div()
sage: D.add_random() # random
{0: 0, 1: 0, 2: 1, 3: 0}
sage: D.add_random([0.1,0.1,0.1,0.7]) # random
{0: 0, 1: 0, 2: 0, 3: 1}
```

Warning: If distrib is not None, the user is responsible for assuring the sum of its entries is 1.

# betti()

The Betti numbers for the support-complex. (See NOTE.)

### **OUTPUT**:

dictionary of integers

```
sage: S = sandpiles.Cycle(3)
sage: D = SandpileDivisor(S, [2,0,1])
sage: D.betti()
{0: 1, 1: 1}
```

**Note:** The "support-complex" is the simplicial complex determined by the supports of the linearly equivalent effective divisors.

#### deq()

The degree of the divisor.

### **OUTPUT:**

integer

### **EXAMPLES:**

```
sage: S = sandpiles.Cycle(3)
sage: D = SandpileDivisor(S, [1,2,3])
sage: D.deg()
6
```

### dualize()

The difference with the maximal stable divisor.

#### **OUTPUT:**

SandpileDivisor

### **EXAMPLES:**

```
sage: S = sandpiles.Cycle(3)
sage: D = SandpileDivisor(S, [1,2,3])
sage: D.dualize()
{0: 0, 1: -1, 2: -2}
sage: S.max_stable_div() - D == D.dualize()
True
```

# effective\_div(verbose=True, with\_firing\_vectors=False)

All linearly equivalent effective divisors. If verbose is False, the divisors are converted to lists of integers. If with\_firing\_vectors is True then a list of firing vectors is also given, each of which prescribes the vertices to be fired in order to obtain an effective divisor.

# INPUT:

```
•verbose - (default: True) boolean

•with_firing_vectors - (default: False) boolean

OUTPUT:

list (of divisors)

EXAMPLES:

sage: s = sandpiles.Complete(4)

sage: D = SandpileDivisor(s, [4, 2, 0, 0])

sage: D.effective_div()

[{0: 0, 1: 6, 2: 0, 3: 0},
{0: 0, 1: 2, 2: 4, 3: 0},
{0: 0, 1: 2, 2: 0, 3: 4},
{0: 1, 1: 3, 2: 1, 3: 1},
```

```
\{0: 2, 1: 0, 2: 2, 3: 2\},\
     \{0: 4, 1: 2, 2: 0, 3: 0\}
    sage: D.effective_div(False)
    [[0, 6, 0, 0],
     [0, 2, 4, 0],
     [0, 2, 0, 4],
     [1, 3, 1, 1],
     [2, 0, 2, 2],
     [4, 2, 0, 0]]
    sage: D.effective_div(with_firing_vectors=True)
    [({0: 0, 1: 6, 2: 0, 3: 0}, (0, -2, -1, -1)),
     (\{0: 0, 1: 2, 2: 4, 3: 0\}, (0, -1, -2, -1)),
     (\{0: 0, 1: 2, 2: 0, 3: 4\}, (0, -1, -1, -2)),
     (\{0: 1, 1: 3, 2: 1, 3: 1\}, (0, -1, -1, -1)),
     ({0: 2, 1: 0, 2: 2, 3: 2}, (0, 0, -1, -1)),
     ({0: 4, 1: 2, 2: 0, 3: 0}, (0, 0, 0, 0))]
    sage: a = _[0]
    sage: a[0].values()
    [0, 6, 0, 0]
    sage: vector(D.values()) - s.laplacian()*a[1]
    (0, 6, 0, 0)
    sage: D.effective_div(False, True)
    [([0, 6, 0, 0], (0, -2, -1, -1)),
     ([0, 2, 4, 0], (0, -1, -2, -1)),
     ([0, 2, 0, 4], (0, -1, -1, -2)),
     ([1, 3, 1, 1], (0, -1, -1, -1)),
     ([2, 0, 2, 2], (0, 0, -1, -1)),
     ([4, 2, 0, 0], (0, 0, 0, 0))]
    sage: D = SandpileDivisor(s, [-1, 0, 0, 0])
    sage: D.effective_div(False, True)
fire_script (sigma)
    Fire the given script. In other words, fire each vertex the number of times indicated by sigma.
    INPUT:
    sigma – SandpileDivisor or (list or dict representing a SandpileDivisor)
    OUTPUT:
    SandpileDivisor
    EXAMPLES:
    sage: S = sandpiles.Cycle(3)
    sage: D = SandpileDivisor(S, [1,2,3])
    sage: D.unstable()
    [1, 2]
    sage: D.fire_script([0,1,1])
    {0: 3, 1: 1, 2: 2}
    sage: D.fire_script(SandpileDivisor(S,[2,0,0])) == D.fire_vertex(0).fire_vertex(0)
    True
fire unstable()
```

128

Fire all unstable vertices.

**OUTPUT:** 

SandpileDivisor

```
EXAMPLES:
    sage: S = sandpiles.Cycle(3)
    sage: D = SandpileDivisor(S, [1,2,3])
    sage: D.fire_unstable()
    {0: 3, 1: 1, 2: 2}
fire_vertex(v)
    Fire the given vertex.
    INPUT:
    v - vertex
    OUTPUT:
    SandpileDivisor
    EXAMPLES:
    sage: S = sandpiles.Cycle(3)
    sage: D = SandpileDivisor(S, [1,2,3])
    sage: D.fire_vertex(1)
    \{0: 2, 1: 0, 2: 4\}
static help (verbose=True)
    List of SandpileDivisor methods. If verbose, include short descriptions.
    INPUT:
    verbose - (default: True) boolean
    OUTPUT:

```

### is\_alive (cycle=False)

Is the divisor stabilizable? In other words, will the divisor stabilize under repeated firings of all unstable vertices? Optionally returns the resulting cycle.

#### INPUT:

```
cycle - (default: False) boolean
```

### **OUTPUT**:

boolean or optionally, a list of SandpileDivisors

#### **EXAMPLES:**

```
sage: S = sandpiles.Complete(4)
sage: D = SandpileDivisor(S, {0: 4, 1: 3, 2: 3, 3: 2})
sage: D.is_alive()
True
sage: D.is_alive(True)
[{0: 4, 1: 3, 2: 3, 3: 2}, {0: 3, 1: 2, 2: 2, 3: 5}, {0: 1, 1: 4, 2: 4, 3: 3}]
```

# is\_linearly\_equivalent (D, with\_firing\_vector=False)

Is the given divisor linearly equivalent? Optionally, returns the firing vector. (See NOTE.)

#### INPUT:

- •D SandpileDivisor or list, tuple, etc. representing a divisor
- •with\_firing\_vector (default: False) boolean

### **OUTPUT**:

boolean or integer vector

```
sage: s = sandpiles.Complete(3)
sage: D = SandpileDivisor(s,[2,0,0])
sage: D.is_linearly_equivalent([0,1,1])
True
sage: D.is_linearly_equivalent([0,1,1],True)
(1, 0, 0)
sage: v = vector(D.is_linearly_equivalent([0,1,1],True))
sage: vector(D.values()) - s.laplacian()*v
(0, 1, 1)
sage: D.is_linearly_equivalent([0,0,0])
False
sage: D.is_linearly_equivalent([0,0,0],True)
()
```

#### Note:

- •If with\_firing\_vector is False, returns either True or False.
- •If with\_firing\_vector is True then: (i) if self is linearly equivalent to D, returns a vector v such that self v\*self.laplacian().transpose() = D. Otherwise, (ii) if self is not linearly equivalent to D, the output is the empty vector, ().

### is\_q\_reduced()

Is the divisor q-reduced? This would mean that self = c + kq where c is superstable, k is an integer, and q is the sink vertex.

### OUTPUT:

boolean

### **EXAMPLES:**

```
sage: s = sandpiles.Complete(4)
sage: D = SandpileDivisor(s,[2,-3,2,0])
sage: D.is_q_reduced()
False
sage: SandpileDivisor(s,[10,0,1,2]).is_q_reduced()
True
```

For undirected or, more generally, Eulerian graphs, *q*-reduced divisors are linearly equivalent if and only if they are equal. The same does not hold for general directed graphs:

```
sage: s = Sandpile({0:[1],1:[1,1]})
sage: D = SandpileDivisor(s,[-1,1])
sage: Z = s.zero_div()
sage: D.is_q_reduced()
True
sage: Z.is_q_reduced()
True
sage: D == Z
False
sage: D.is_linearly_equivalent(Z)
True
```

## is symmetric(orbits)

Is the divisor symmetric? Return True if the values of the configuration are constant over the vertices in each sublist of orbits.

### INPUT:

orbits - list of lists of vertices

### **OUTPUT**:

boolean

```
sage: S = sandpiles.House()
sage: S.dict()
{0: {1: 1, 2: 1},
    1: {0: 1, 3: 1},
    2: {0: 1, 3: 1, 4: 1},
    3: {1: 1, 2: 1, 4: 1},
    4: {2: 1, 3: 1}}
sage: D = SandpileDivisor(S, [0,0,1,1,3])
```

```
sage: D.is_symmetric([[2,3], [4]])
    True
is_weierstrass_pt(v='sink')
    Is the given vertex a Weierstrass point?
    INPUT:
    v – (default: sink) vertex
    OUTPUT:
    boolean
    EXAMPLES:
    sage: s = sandpiles.House()
    sage: K = s.canonical_divisor()
    sage: K.weierstrass_rank_seg() # sequence at the sink vertex, 0
    (1, 0, -1)
    sage: K.is_weierstrass_pt()
    False
    sage: K.weierstrass_rank_seq(4)
    (1, 0, 0, -1)
    sage: K.is_weierstrass_pt(4)
    True
    Note: The vertex v is a (generalized) Weierstrass point for divisor D if the sequence of ranks r(D-nv)
    for n = 0, 1, 2, \dots is not r(D), r(D) - 1, \dots, 0, -1, -1, \dots
linear system()
    The complete linear system (deprecated: use polytope_integer_pts).
    OUTPUT:
    dict - {num_homog: int, homog:list, num_inhomog:int, inhomog:list}
    EXAMPLES:
    sage: S = Sandpile({0: {}},
    ....: 1: {0: 1, 3: 1, 4: 1},
    \dots: 2: {0: 1, 3: 1, 5: 1},
    \dots: 3: {2: 1, 5: 1},
    ....: 4: {1: 1, 3: 1},
    ....: 5: {2: 1, 3: 1}}
    ...:)
    sage: D = SandpileDivisor(S, [0,0,0,0,0,2])
    sage: D.linear_system() # known bug (won't fix due to deprecation optional - 4ti2)
    {'homog': [[1, 0, 0, 0, 0], [-1, 0, 0, 0, 0]],
     'inhomog': [[0, 0, 0, 0, 0, -1], [0, 0, -1, -1, 0, -2], [0, 0, 0, 0, 0, 0]],
     'num_homog': 2,
     'num_inhomog': 3}
```

**Note:** If L is the Laplacian, an arbitrary v such that  $v \cdot L \ge -D$  has the form v = w + t where w is in inhomg and t is in the integer span of homog in the output of linear\_system(D).

**Warning:** This method requires 4ti2.

### polytope()

The polytope determining the complete linear system.

#### **OUTPUT:**

polytope

### **EXAMPLES:**

```
sage: s = sandpiles.Complete(4)
sage: D = SandpileDivisor(s,[4,2,0,0])
sage: p = D.polytope()
sage: p.inequalities()
(An inequality (-3, 1, 1) x + 2 >= 0,
   An inequality (1, 1, 1) x + 4 >= 0,
   An inequality (1, -3, 1) x + 0 >= 0,
   An inequality (1, 1, -3) x + 0 >= 0)
sage: D = SandpileDivisor(s,[-1,0,0,0])
sage: D.polytope()
The empty polyhedron in QQ^3
```

**Note:** For a divisor D, this is the intersection of (i) the polyhedron determined by the system of inequalities  $L^t x \leq D$  where  $L^t$  is the transpose of the Laplacian with (ii) the hyperplane  $x_{\text{sink\_vertex}} = 0$ . The polytope is thought of as sitting in (n-1)-dimensional Euclidean space where n is the number of vertices.

### polytope\_integer\_pts()

The integer points inside divisor's polytope. The polytope referred to here is the one determining the divisor's complete linear system (see the documentation for polytope).

### **OUTPUT:**

tuple of integer vectors

### **EXAMPLES:**

### q\_reduced (verbose=True)

The linearly equivalent q-reduced divisor.

# INPUT:

verbose - (default: True) boolean

## **OUTPUT:**

SandpileDivisor or list representing SandpileDivisor

```
sage: s = sandpiles.Complete(4)
sage: D = SandpileDivisor(s,[2,-3,2,0])
sage: D.q_reduced()
{0: -2, 1: 1, 2: 2, 3: 0}
sage: D.q_reduced(False)
[-2, 1, 2, 0]
```

**Note:** The divisor D is qreducedif'D = c + kq where c is superstable, k is an integer, and q is the sink.

### r\_of\_D (verbose=False)

The rank of the divisor (deprecated: use rank, instead). Returns r(D) and, if verbose is True, an effective divisor F such that |D - F| is empty.

### INPUT:

```
verbose - (default: False) boolean
```

sage:  $S = Sandpile({0: {}},$ 

### **OUTPUT:**

integer r(D) or tuple (integer r(D), divisor F)

#### **EXAMPLES:**

```
....: 1: {0: 1, 3: 1, 4: 1},
....: 2: {0: 1, 3: 1, 5: 1},
....: 3: {2: 1, 5: 1},
....: 4: {1: 1, 3: 1},
....: 5: {2: 1, 3: 1}}
. . . . : )
sage: D = SandpileDivisor(S, [0,0,0,0,0,4]) # optional - 4ti2
sage: E = D.r_of_D(True) # optional - 4ti2
doctest:... DeprecationWarning: D.r_of_D() will be removed soon. Please use ''D.rank()'' in
See http://trac.sagemath.org/18618 for details.
sage: E # optional - 4ti2
(1, \{0: 0, 1: 1, 2: 0, 3: 1, 4: 0, 5: 0\})
sage: F = E[1] \# optional - 4ti2
sage: (D - F).values() # optional - 4ti2
[0, -1, 0, -1, 0, 4]
sage: (D - F).effective_div() # optional - 4ti2
sage: SandpileDivisor(S, [0,0,0,0,0,-4]).r_of_D(True) # optional - 4ti2
```

# rank (with\_witness=False)

The rank of the divisor. Optionally returns an effective divisor E such that D-E is not winnable (has an empty complete linear system).

### INPUT:

```
with_witness - (default: False) boolean
```

### **OUTPUT**:

integer or (integer, SandpileDivisor)

### **EXAMPLES**:

```
sage: S = sandpiles.Complete(4)
sage: D = SandpileDivisor(S,[4,2,0,0])
sage: D.rank()
```

 $(-1, \{0: 0, 1: 0, 2: 0, 3: 0, 4: 0, 5: -4\})$ 

```
3
   sage: D.rank(True)
   (3, \{0: 3, 1: 0, 2: 1, 3: 0\})
   sage: E = [1]
   sage: (D - E).rank()
Riemann-Roch theorem::
   sage: D.rank() - (S.canonical_divisor()-D).rank() == D.deg() + 1 - S.genus()
   True
Riemann-Roch theorem::
   sage: D.rank() - (S.canonical_divisor()-D).rank() == D.deg() + 1 - S.genus()
   sage: S = Sandpile(\{0:[1,1,1,2],1:[0,0,0,1,1,1,2,2],2:[2,2,1,1,0]\},0) \# multigraph with I
   sage: D = SandpileDivisor(S, [4, 2, 0])
   sage: D.rank(True)
   (2, \{0: 1, 1: 1, 2: 1\})
   sage: S = Sandpile({0:[1,2], 1:[0,2,2], 2: [0,1]},0) # directed graph
   sage: S.is_undirected()
  False
   sage: D = SandpileDivisor(S, [0, 2, 0])
   sage: D.effective_div()
   [\{0: 0, 1: 2, 2: 0\}, \{0: 2, 1: 0, 2: 0\}]
   sage: D.rank(True)
   (0, {0: 0, 1: 0, 2: 1})
   sage: E = D.rank(True)[1]
   sage: (D - E).effective_div()
```

**Note:** The rank of a divisor D is -1 if D is not linearly equivalent to an effective divisor (i.e., the dollar game represented by D is unwinnable). Otherwise, the rank of D is the largest integer r such that D-E is linearly equivalent to an effective divisor for all effective divisors E with  $\deg(E) = r$ .

### sandpile()

The divisor's underlying sandpile.

### **OUTPUT:**

Sandpile

## **EXAMPLES:**

```
sage: S = sandpiles.Diamond()
sage: D = SandpileDivisor(S,[1,-2,0,3])
sage: D.sandpile()
Diamond sandpile graph: 4 vertices, sink = 0
sage: D.sandpile() == S
True
```

**show** (heights=True, directed=None, \*\*kwds)

Show the divisor.

INPUT:

•heights - (default: True) whether to label each vertex with the amount of sand

- •directed (optional) whether to draw directed edges
- •kwds (optional) arguments passed to the show method for Graph

### **EXAMPLES:**

```
sage: S = sandpiles.Diamond()
sage: D = SandpileDivisor(S,[1,-2,0,2])
sage: D.show(graph_border=True,vertex_size=700,directed=False)
```

# simulate\_threshold(distrib=None)

The first unstabilizable divisor in the closed Markov chain. (See NOTE.)

#### INPUT:

distrib - (optional) list of nonnegative numbers representing a probability distribution on the vertices

### **OUTPUT:**

SandpileDivisor

### **EXAMPLES:**

```
sage: s = sandpiles.Complete(4)
sage: D = s.zero_div()
sage: D.simulate_threshold() # random
{0: 2, 1: 3, 2: 1, 3: 2}
sage: n(mean([D.simulate_threshold().deg() for _ in range(10)])) # random
7.10000000000000
sage: n(s.stationary_density()*s.num_verts())
6.93750000000000
```

**Note:** Starting at self, repeatedly choose a vertex and add a grain of sand to it. Return the first unstabilizable divisor that is reached. Also see the markov\_chain method for the underlying sandpile.

# stabilize(with\_firing\_vector=False)

The stabilization of the divisor. If not stabilizable, return an error.

### INPUT:

```
with_firing_vector - (default: False) boolean
```

# **EXAMPLES:**

```
sage: s = sandpiles.Complete(4)
sage: D = SandpileDivisor(s,[0,3,0,0])
sage: D.stabilize()
{0: 1, 1: 0, 2: 1, 3: 1}
sage: D.stabilize(with_firing_vector=True)
[{0: 1, 1: 0, 2: 1, 3: 1}, {0: 0, 1: 1, 2: 0, 3: 0}]
```

### support()

List of vertices at which the divisor is nonzero.

#### **OUTPUT:**

list representing the support of the divisor

```
sage: S = sandpiles.Cycle(4)
sage: D = SandpileDivisor(S, [0,0,1,1])
sage: D.support()
[2, 3]
```

```
sage: S.vertices()
    [0, 1, 2, 3]
unstable()
    The unstable vertices.
    OUTPUT:
    list of vertices
    EXAMPLES:
    sage: S = sandpiles.Cycle(3)
    sage: D = SandpileDivisor(S, [1,2,3])
    sage: D.unstable()
    [1, 2]
values()
    The values of the divisor as a list. The list is sorted in the order of the vertices.
    OUTPUT:
    list of integers
    boolean
    EXAMPLES:
    sage: S = Sandpile({'a':[1,'b'], 'b':[1,'a'], 1:['a']},'a')
    sage: D = SandpileDivisor(S, {'a':0, 'b':1, 1:2})
    sage: D
    {'a': 0, 1: 2, 'b': 1}
    sage: D.values()
    [2, 0, 1]
    sage: S.vertices()
    [1, 'a', 'b']
weierstrass_div(verbose=True)
    The Weierstrass divisor. Its value at a vertex is the weight of that vertex as a Weierstrass point. (See
    SandpileDivisor.weierstrass gap seg.)
    INPUT:
    verbose - (default: True) boolean
    OUTPUT:
    SandpileDivisor
    EXAMPLES:
    sage: s = sandpiles.Diamond()
    sage: D = SandpileDivisor(s, [4, 2, 1, 0])
    sage: [D.weierstrass_rank_seq(v) for v in s]
    [(5, 4, 3, 2, 1, 0, 0, -1),
     (5, 4, 3, 2, 1, 0, -1),
     (5, 4, 3, 2, 1, 0, 0, 0, -1),
     (5, 4, 3, 2, 1, 0, 0, -1)]
    sage: D.weierstrass_div()
    {0: 1, 1: 0, 2: 2, 3: 1}
    sage: k5 = sandpiles.Complete(5)
    sage: K = k5.canonical_divisor()
```

```
sage: K.weierstrass_div()
{0: 9, 1: 9, 2: 9, 3: 9, 4: 9}
```

### weierstrass\_gap\_seq(v='sink', weight=True)

The Weierstrass gap sequence at the given vertex. If weight is True, then also compute the weight of each gap value.

### **INPUT:**

```
•v - (default: sink) vertex
•weight - (default: True) boolean
```

### **OUTPUT:**

list or (list of list) of integers

### **EXAMPLES:**

```
sage: s = sandpiles.Cycle(4)
sage: D = SandpileDivisor(s,[2,0,0,0])
sage: [D.weierstrass_gap_seq(v,False) for v in s.vertices()]
[(1, 3), (1, 2), (1, 3), (1, 2)]
sage: [D.weierstrass_gap_seq(v) for v in s.vertices()]
[((1, 3), 1), ((1, 2), 0), ((1, 3), 1), ((1, 2), 0)]
sage: D.weierstrass_gap_seq() # gap sequence at sink vertex, 0
((1, 3), 1)
sage: D.weierstrass_rank_seq() # rank sequence at the sink vertex
(1, 0, 0, -1)
```

**Note:** The integer k is a Weierstrass gap for the divisor D at vertex v if the rank of D-(k-1)v does not equal the rank of D-kv. Let r be the rank of D and let  $k_i$  be the i-th gap at v. The Weierstrass weight of v for D is the sum of  $(k_i-i)$  as i ranges from 1 to v + 1. It measure the difference between the sequence v + v - v

### weierstrass pts(with rank seq=False)

The Weierstrass points (vertices). Optionally, return the corresponding rank sequences.

# INPUT:

```
with_rank_seq - (default: False) boolean
```

# OUTPUT:

tuple of vertices or list of (vertex, rank sequence)

### **EXAMPLES:**

```
sage: s = sandpiles.House()
sage: K = s.canonical_divisor()
sage: K.weierstrass_pts()
(4,)
sage: K.weierstrass_pts(True)
[(4, (1, 0, 0, -1))]
```

**Note:** The vertex v is a (generalized) Weierstrass point for divisor D if the sequence of ranks r(D-nv) for  $n=0,1,2,\ldots$  'is not  $r(D),r(D)-1,\ldots,0,-1,-1,\ldots$ 

### weierstrass\_rank\_seq(v='sink')

The Weierstrass rank sequence at the given vertex. Computes the rank of the divisor D - nv starting with

```
n=0 and ending when the rank is -1.
         INPUT:
         v – (default: sink) vertex
         OUTPUT:
         tuple of int
         EXAMPLES:
         sage: s = sandpiles.House()
         sage: K = s.canonical_divisor()
         sage: [K.weierstrass_rank_seq(v) for v in s.vertices()]
         [(1, 0, -1), (1, 0, -1), (1, 0, -1), (1, 0, -1), (1, 0, 0, -1)]
sage.sandpiles.sandpile.admissible_partitions (S, k)
     The partitions of the vertices of S into k parts, each of which is connected.
     INPUT:
     S – Sandpile
     k - integer
     OUTPUT:
     list of partitions
     EXAMPLES:
     sage: S = sandpiles.Cycle(4)
     sage: P = [admissible_partitions(S, i) for i in [2,3,4]]
     doctest:...: DeprecationWarning:
     Importing admissible_partitions from here is deprecated. If you need to use it, please import it
     See http://trac.sagemath.org/18618 for details.
     sage: P
     [[{{0}, {1, 2, 3}},
       \{\{0, 2, 3\}, \{1\}\},\
       \{\{0, 1, 3\}, \{2\}\},\
       \{\{0, 1, 2\}, \{3\}\},\
       {{0, 1}, {2, 3}},
       {{0, 3}, {1, 2}}],
      [\{\{0\}, \{1\}, \{2, 3\}\},
       \{\{0\}, \{1, 2\}, \{3\}\},\
       \{\{0, 3\}, \{1\}, \{2\}\},\
       \{\{0, 1\}, \{2\}, \{3\}\}\}
      [\{\{0\}, \{1\}, \{2\}, \{3\}\}]]
     sage: for p in P:
            sum([partition_sandpile(S, i).betti(verbose=False)[-1] for i in p])
     doctest:...: DeprecationWarning:
     Importing partition_sandpile from here is deprecated. If you need to use it, please import it di

                              8
```

```
sage.sandpiles.sandpile.aztec_sandpile(n)
    The aztec diamond graph.
    INPUT:
    n - integer
    OUTPUT:
    dictionary for the aztec diamond graph
    EXAMPLES:
    sage: aztec_sandpile(2)
    doctest:...: DeprecationWarning:
    Importing aztec_sandpile from here is deprecated. If you need to use it, please import it direct
    See http://trac.sagemath.org/18618 for details.

      (3/2, 1/2): {'sink': 2, (1/2, 1/2): 1, (3/2, -1/2): 1}}
    sage: Sandpile(aztec_sandpile(2),'sink').group_order()
    4542720
```

**Note:** This is the aztec diamond graph with a sink vertex added. Boundary vertices have edges to the sink so that each vertex has degree 4.

```
sage.sandpiles.sandpile.complete_sandpile(n)
The sandpile on the complete graph with n vertices.
INPUT:
n - positive integer
OUTPUT:
```

140

Sandpile EXAMPLES:

```
sage: K = sandpiles.Complete(5)
     sage: K.betti(verbose=False)
     [1, 15, 50, 60, 24]
sage.sandpiles.sandpile.firing_graph(S, eff)
     Creates a digraph with divisors as vertices and edges between two divisors D and E if firing a single vertex in
     D gives E.
     INPUT:
     S - Sandpile
     eff-list of divisors
     OUTPUT:
     DiGraph
     EXAMPLES:
     sage: S = sandpiles.Cycle(6)
     sage: D = SandpileDivisor(S, [1,1,1,1,2,0])
     sage: eff = D.effective_div()
     sage: firing_graph(S,eff).show3d(edge_size=.005,vertex_size=0.01)
sage.sandpiles.sandpile.firing_vector (S, D, E)
     If D and E are linearly equivalent divisors, find the firing vector taking D to E.
     INPUT:
        •S - Sandpile
        •D, E – tuples (representing linearly equivalent divisors)
     OUTPUT:
     tuple (representing a firing vector from D to E)
     EXAMPLES:
     sage: S = sandpiles.Complete(4)
     sage: D = SandpileDivisor(S, \{0: 0, 1: 0, 2: 8, 3: 0\})
     sage: E = SandpileDivisor(S, \{0: 2, 1: 2, 2: 2, 3: 2\})
     sage: v = firing_vector(S, D, E)
     doctest:...: DeprecationWarning: firing_vector() will soon be removed. Use SandpileDivisor.is_l
     See http://trac.sagemath.org/18618 for details.
     doctest:...: DeprecationWarning: May 25, 2015: Replaced by SandpileDivisor.is_linearly_equivaler
     See http://trac.sagemath.org/18618 for details.
     sage: v
     (0, 0, 2, 0)
     The divisors must be linearly equivalent:
     sage: vector(D.values()) - S.laplacian()*vector(v) == vector(E.values())
     True
     sage: firing_vector(S, D, S.zero_div())
     Error. Are the divisors linearly equivalent?
sage.sandpiles.sandpile.glue_graphs (g, h, glue_g, glue_h)
     Glue two graphs together.
     INPUT:
        •q, h – dictionaries for directed multigraphs
```

•glue\_h, glue\_g - dictionaries for a vertex

#### **OUTPUT:**

dictionary for a directed multigraph

#### **EXAMPLES:**

```
sage: x = \{0: \{\}, 1: \{0: 1\}, 2: \{0: 1, 1: 1\}, 3: \{0: 1, 1: 1, 2: 1\}\}
sage: y = \{0: \{\}, 1: \{0: 2\}, 2: \{1: 2\}, 3: \{0: 1, 2: 1\}\}
sage: glue_x = \{1: 1, 3: 2\}
sage: glue_y = {0: 1, 1: 2, 3: 1}
sage: z = glue_graphs(x,y,glue_x,glue_y)
doctest:...: DeprecationWarning:
Importing glue graphs from here is deprecated. If you need to use it,
please import it directly from sage.sandpiles.sandpile
See http://trac.sagemath.org/18618 for details.
sage: z
{0: {},
'x0': {0: 1, 'x1': 1, 'x3': 2, 'y1': 2, 'y3': 1},
'x1': {'x0': 1},
 'x2': \{'x0': 1, 'x1': 1\},
 'x3': {'x0': 1, 'x1': 1, 'x2': 1},
 'y1': {0: 2},
 'y2': {'y1': 2},
 'y3': {0: 1, 'y2': 1}}
sage: S = Sandpile(z, 0)
sage: S.h_vector()
[1, 6, 17, 31, 41, 41, 31, 17, 6, 1]
sage: S.resolution()
'R^1 <-- R^7 <-- R^21 <-- R^35 <-- R^35 <-- R^21 <-- R^7 <-- R^1'
```

**Note:** This method makes a dictionary for a graph by combining those for g and h. The sink of g is replaced by a vertex that is connected to the vertices of g as specified by  $glue_g$  the vertices of g as specified in  $glue_h$ . The sink of the glued graph is  $glue_g$ .

Both glue\_g and glue\_h are dictionaries with entries of the form v:w where v is the vertex to be connected to and w is the weight of the connecting edge.

```
sage.sandpiles.sandpile.grid_sandpile(m, n)
```

The  $m \times n$  grid sandpile. Each nonsink vertex has degree 4.

## INPUT:

m, n – positive integers

#### **OUTPUT:**

Sandpile with sink named sink.

### **EXAMPLES:**

```
sage: G = grid_sandpile(3,4)
doctest:...: DeprecationWarning: grid_sandpile() will soon be removed. Use sandpile.Grid() inst
See http://trac.sagemath.org/18618 for details.
doctest:...: DeprecationWarning: May 25, 2015: Replaced by sandpiles.Grid.
See http://trac.sagemath.org/18618 for details.
sage: G.dict()
{'sink': {},
    (1, 1): {'sink': 2, (1, 2): 1, (2, 1): 1},
    (1, 2): {'sink': 1, (1, 1): 1, (1, 3): 1, (2, 2): 1},
    (1, 3): {'sink': 1, (1, 2): 1, (1, 4): 1, (2, 3): 1},
```

```
(1, 4): {'sink': 2, (1, 3): 1, (2, 4): 1},
      (2, 1): {'sink': 1, (1, 1): 1, (2, 2): 1, (3, 1): 1},
      (2, 2): {(1, 2): 1, (2, 1): 1, (2, 3): 1, (3, 2): 1},
      (2, 3): \{(1, 3): 1, (2, 2): 1, (2, 4): 1, (3, 3): 1\},
      (2, 4): {'sink': 1, (1, 4): 1, (2, 3): 1, (3, 4): 1},
      (3, 1): {'sink': 2, (2, 1): 1, (3, 2): 1},
      (3, 2): {'sink': 1, (2, 2): 1, (3, 1): 1, (3, 3): 1},
      (3, 3): {'sink': 1, (2, 3): 1, (3, 2): 1, (3, 4): 1},
      (3, 4): {'sink': 2, (2, 4): 1, (3, 3): 1}}
     sage: G.group_order()
     4140081
     sage: G.invariant_factors()
     [1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 3, 1380027]
sage.sandpiles.sandpile.min_cycles(G, v)
     Minimal length cycles in the digraph G starting at vertex v.
     INPUT:
        •G – DiGraph
        •v – vertex of G
     OUTPUT:
     list of lists of vertices
     EXAMPLES:
     sage: T = sandlib('gor')
     sage: [min_cycles(T, i) for i in T.vertices()]
     doctest:...: DeprecationWarning:
     Importing min_cycles from here is deprecated. If you need to use it, please import it directly f
     See http://trac.sagemath.org/18618 for details.
     [[], [[1, 3]], [[2, 3, 1], [2, 3]], [[3, 1], [3, 2]]]
sage.sandpiles.sandpile.parallel_firing_graph(S, eff)
     Creates a digraph with divisors as vertices and edges between two divisors D and E if firing all unstable vertices
     in D gives E.
     INPUT:
     S - Sandpile
     eff - list of divisors
     OUTPUT:
     DiGraph
     EXAMPLES:
     sage: S = sandpiles.Cycle(6)
     sage: D = SandpileDivisor(S, [1,1,1,1,2,0])
     sage: eff = D.effective_div()
     sage: parallel_firing_graph(S,eff).show3d(edge_size=.005,vertex_size=0.01)
sage.sandpiles.sandpile.partition_sandpile(S, p)
     Each set of vertices in p is regarded as a single vertex, with and edge between A and B if some element of A is
     connected by an edge to some element of B in S.
     INPUT:
```

```
S – Sandpile
     p – partition of the vertices of S
     OUTPUT:
     Sandpile
     EXAMPLES:
     sage: S = sandpiles.Cycle(4)
     sage: P = [admissible_partitions(S, i) for i in [2,3,4]]
     sage: for p in P:
            sum([partition_sandpile(S, i).betti(verbose=False)[-1] for i in p])
     8
     3
     sage: S.betti()
               0
                      1
        0: 1
         1:
                      6
     total: 1 6
                            8
sage.sandpiles.sandpile.random_DAG (num\_verts, p=0.5, weight\_max=1)
     A random directed acyclic graph with num_verts vertices. The method starts with the sink vertex and adds
     vertices one at a time. Each vertex is connected only to only previously defined vertices, and the probability of
     each possible connection is given by the argument p. The weight of an edge is a random integer between 1 and
     weight_max.
     INPUT:
```

```
•num_verts - positive integer
```

•p – (default: 0,5) real number such that 0

•weight\_max - (default: 1) positive integer

### **OUTPUT**:

a dictionary, encoding the edges of a directed acyclic graph with sink 0

#### **EXAMPLES:**

```
sage: d = DiGraph(random_DAG(5, .5)); d
Digraph on 5 vertices
```

## TESTS:

Check that we can construct a random DAG with the default arguments (trac ticket #12181):

```
sage: g = random_DAG(5);DiGraph(g)
Digraph on 5 vertices
```

#### Check that bad inputs are rejected:

```
sage: g = random_DAG(5,1.1)
Traceback (most recent call last):
...
ValueError: The parameter p must satisfy 0
```

```
sage.sandpiles.sandpile.random_digraph (num_verts, p=0.5, directed=True, weight_max=1)
     A random weighted digraph with a directed spanning tree rooted at 0. If directed = False, the only
     difference is that if (i, j, w) is an edge with tail i, head j, and weight w, then (j, i, w) appears also. The result is
     returned as a Sage digraph.
     INPUT:
         •num verts - number of vertices
         •p – (default: 0.5) probability edges occur
         •directed - (default: True) if directed
         •weight_max - (default: 1) integer maximum for random weights
     OUTPUT:
     random graph
     EXAMPLES:
     sage: g = random_digraph(6,0.2,True,3)
     doctest:...: DeprecationWarning: random_digraph will be removed soon. Use any of the Random* me
     from graphs() and from digraphs() instead.
     See http://trac.sagemath.org/18618 for details.
     sage: S = Sandpile(g, 0)
     sage: S.show(edge_labels = True)
     TESTS:
     Check that we can construct a random digraph with the default arguments (trac ticket #12181):
     sage: random_digraph(5)
     Digraph on 5 vertices
sage.sandpiles.sandpile.random_tree (n, d)
     A random undirected tree with n nodes, no node having degree higher than d.
     INPUT:
     n, d - integers
     OUTPUT:
     Graph
     EXAMPLES:
     sage: T = random_tree(15,3)
     doctest:...: DeprecationWarning: random_tree will be removed soon. Use graphs.RandomTree() inst
     See http://trac.sagemath.org/18618 for details.
     sage: T.show()
     sage: S = Sandpile(T, 0)
     sage: U = S.reorder_vertices()
     sage: U.show()
sage.sandpiles.sandpile.sandlib(selector=None)
     Returns the sandpile identified by selector. If no argument is given, a description of the sandpiles in the
     sandlib is printed.
     INPUT:
     selector – (optional) identifier or None
```

### **OUTPUT**:

sandpile or description

```
EXAMPLES:
```

```
sage: sandlib()
doctest:...: DeprecationWarning: sandlib() will soon be removed. Use sandpile() instead.
See http://trac.sagemath.org/18618 for details.

Sandpiles in the sandlib:
   kite : generic undirected graphs with 5 vertices
   generic : generic digraph with 6 vertices
   genus2 : Undirected graph of genus 2
   cil : complete intersection, non-DAG but equivalent to a DAG
   riemann-roch1 : directed graph with postulation 9 and 3 maximal weight superstables
   riemann-roch2 : directed graph with a superstable not majorized by a maximal superstable
   gor : Gorenstein but not a complete intersection
sage: S = sandlib('gor')
sage: S.resolution()
'R^1 <-- R^5 <-- R^5 <-- R^1'</pre>
```

## $sage.sandpiles.sandpile.triangle_sandpile(n)$

A triangular sandpile. Each nonsink vertex has out-degree six. The vertices on the boundary of the triangle are connected to the sink.

INPUT:

n - integer

**OUTPUT:** 

Sandpile

```
EXAMPLES:
```

```
sage: T = triangle_sandpile(5)
doctest:...: DeprecationWarning:
Importing triangle_sandpile from here is deprecated. If you need to use it, please import it dir
See http://trac.sagemath.org/18618 for details.
sage: T.group_order()
135418115000
```

```
sage.sandpiles.sandpile.wilmes_algorithm(M)
```

Computes an integer matrix L with the same integer row span as M and such that L is the reduced Laplacian of a directed multigraph.

INPUT:

M – square integer matrix of full rank

**OUTPUT**:

integer matrix (L)

#### **EXAMPLES:**
